Learning Objectives

- At the end of this lectures, participants will be able to:
  - Recognize the Lipid Metabolism.
  - Understand the pathogenesis of hypertriglyceridemia on Pancreatitis and CVD risk.
  - Recognize the primary and secondary causes of hypertriglyceridemia.
  - Understand the treatment for hypertriglyceridemia-based pancreatitis or cardiovascular risk.
  - Recognize and understand the use of Omega 3 on hypertriglyceridemia.

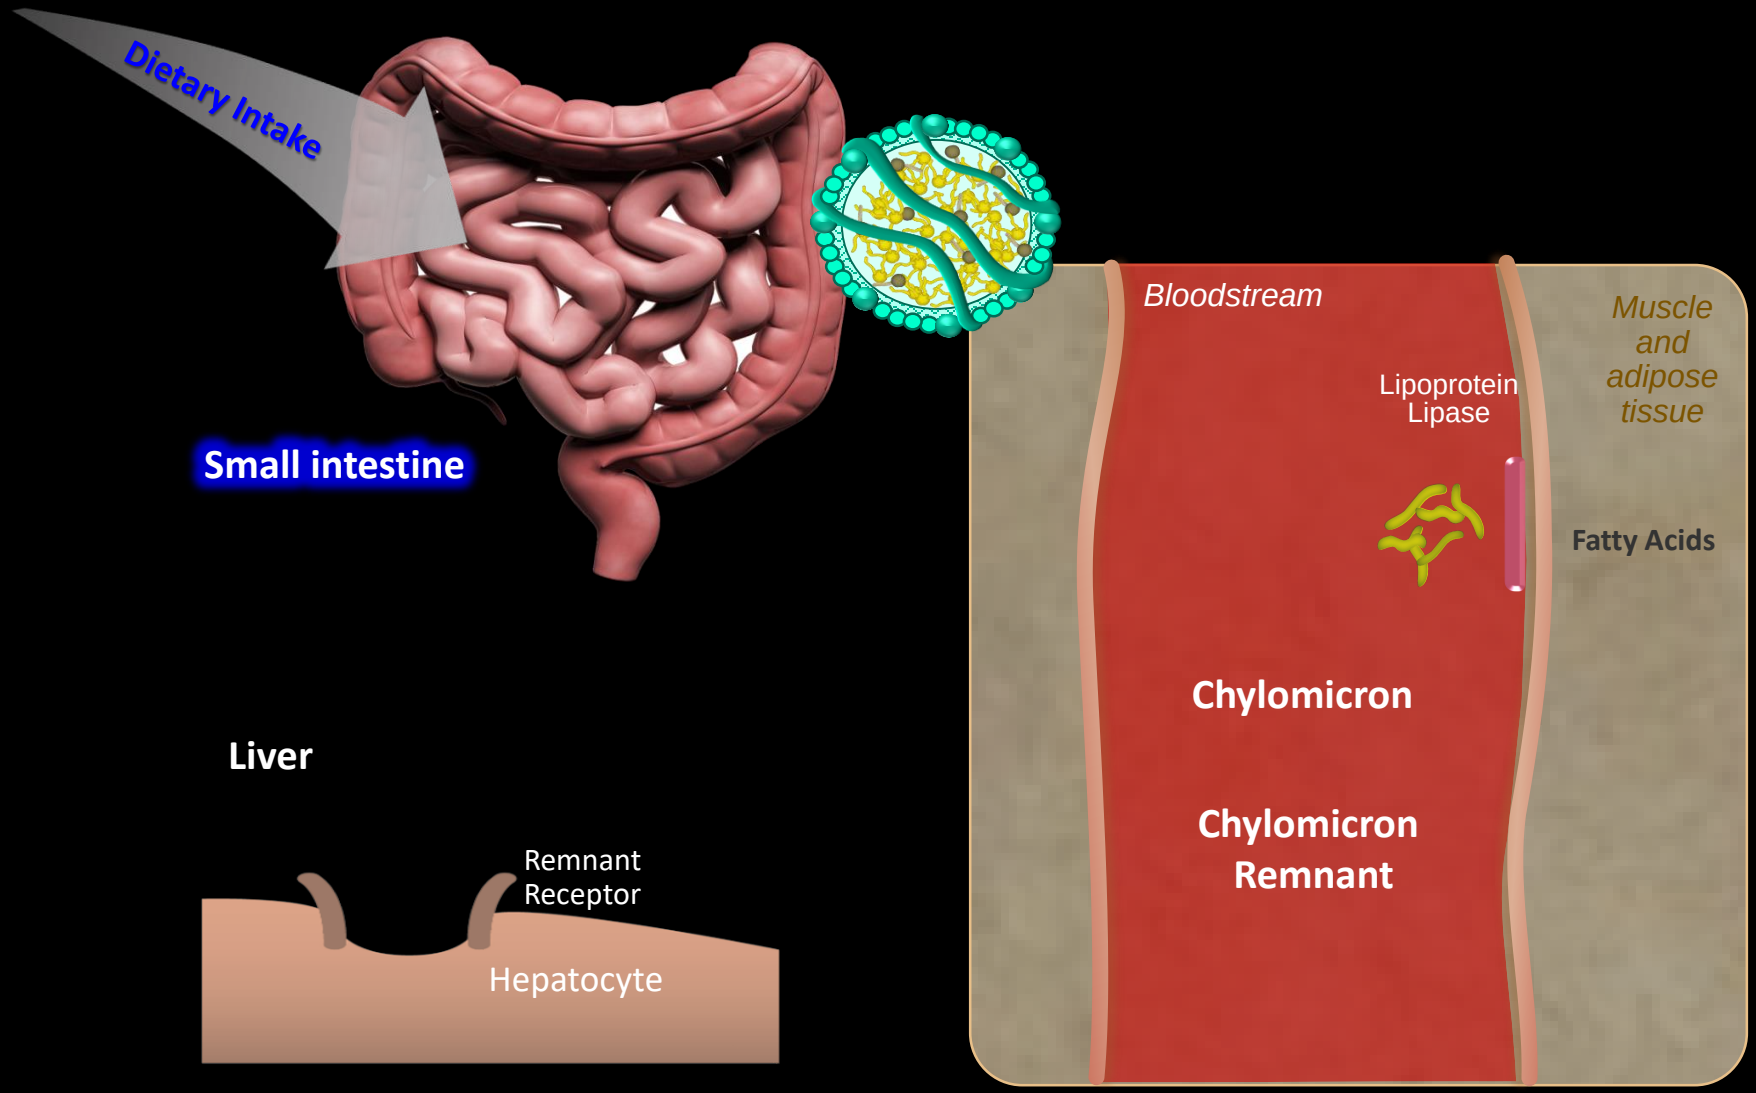
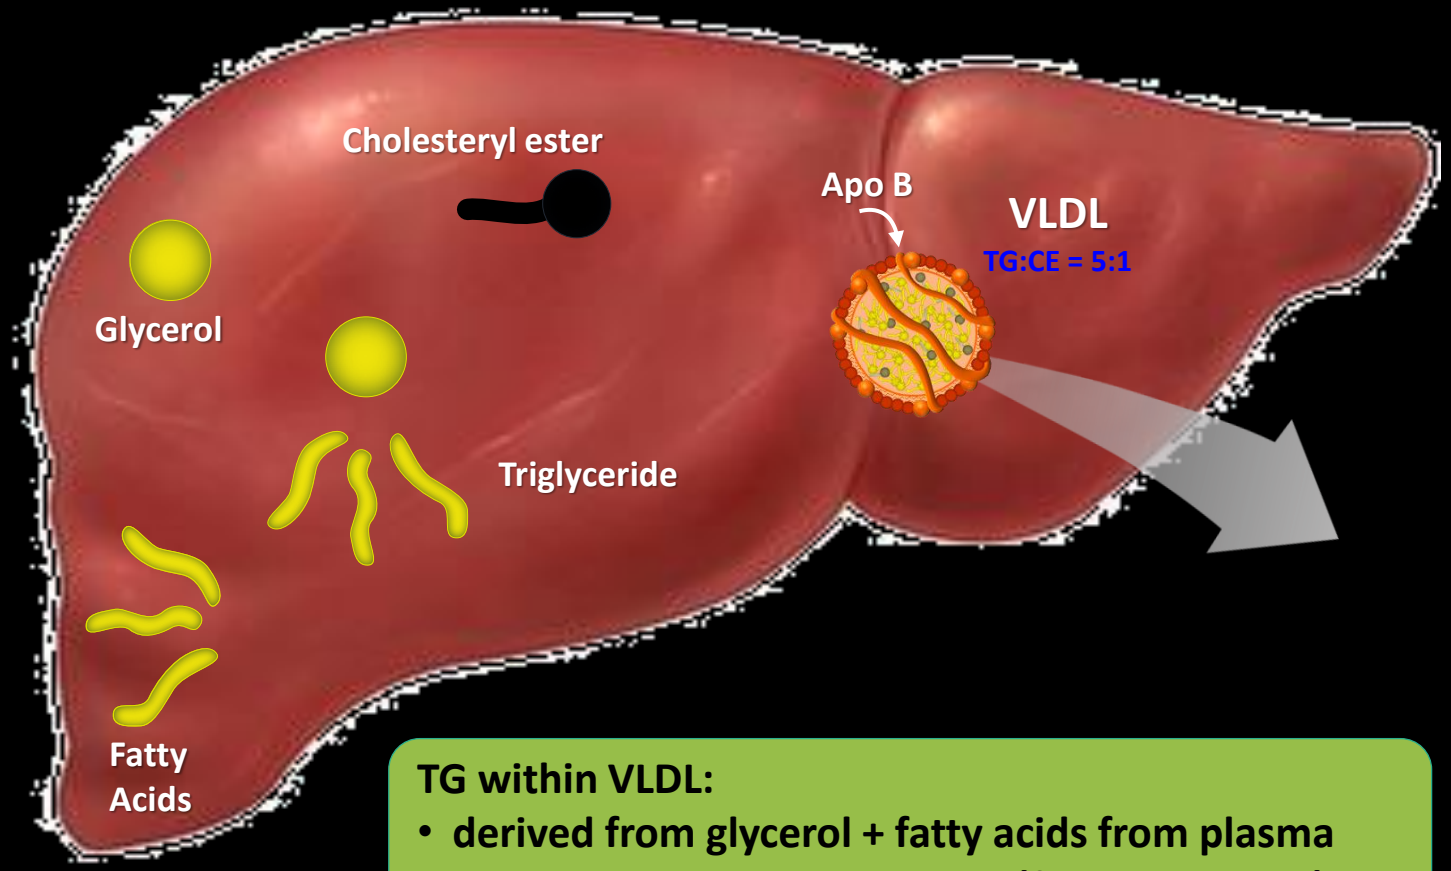
Normal Metabolism of TGRLp: Exogenous (Dietary Origin)



1. Miller M, Stone NJ, Ballantyne C, et al. Triglycerides and cardiovascular disease: a scientific statement from the American Heart Association. *Circulation*. 2011;123(20):2292-2333. 2. Grundy SM. Atlas of atherosclerosis and metabolic syndrome. Chapters 4 and 5. 4th edition. Current Medicine LLC. 2005.

Normal Metabolism of TGRLp: Endogenous (Hepatic Origin)

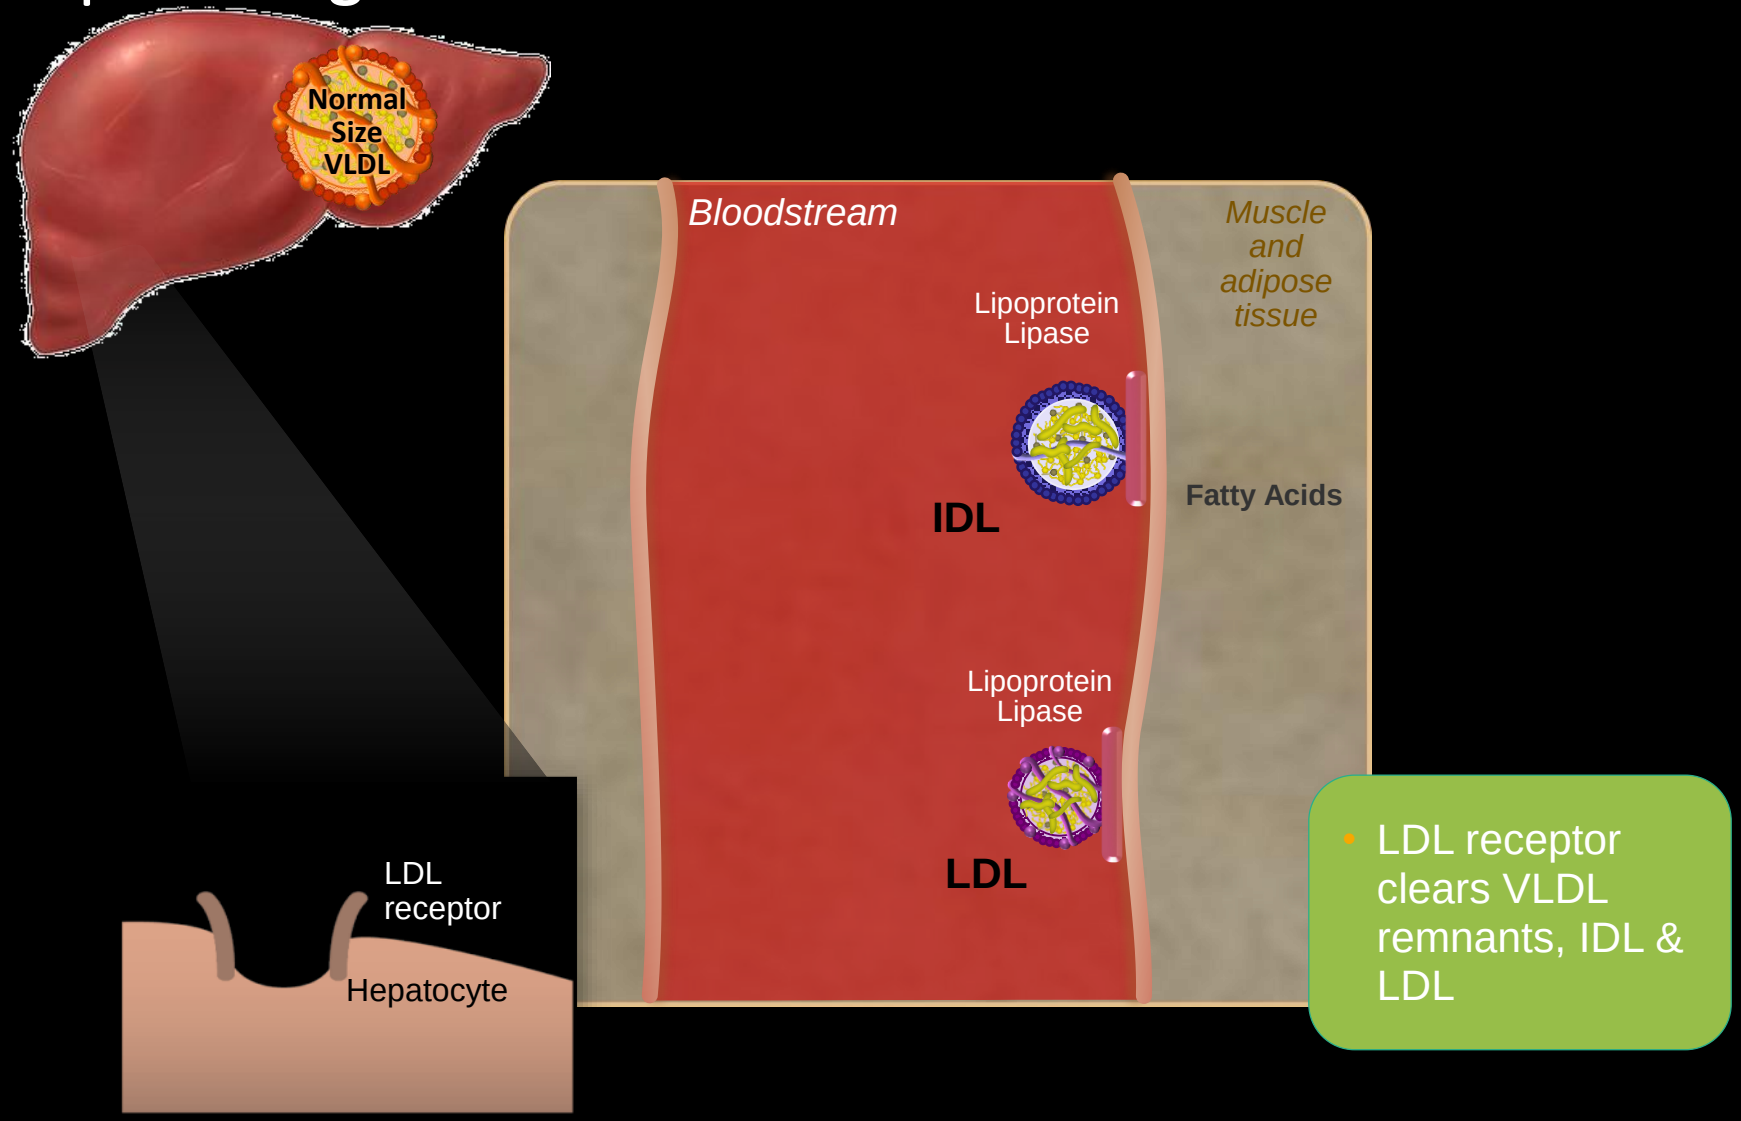


TG within VLDL:
- **derived from glycerol + fatty acids from plasma**
- **newly synthesized in the liver (fructose driven)**

Apo, apolipoprotein; VLDL, very low-density lipoprotein; CE, cholesteryl ester

Kwiterovich PO. Johns Hopkins Textbook of Dyslipidemia. 2009.; Miller M, et al. *Circulation*. 2011;123:2292-2333.; Grundy SM. Atlas of atherosclerosis and metabolic syndrome. 2005.

Normal Plasma Metabolism of TGRLp: Hepatic Origin



- LDL receptor clears VLDL remnants, IDL & LDL

IDL, intermediate-density lipoproteins; LDL, low-density lipoprotein

Kwiterovich PO. Johns Hopkins Textbook of Dyslipidemia. 2009. Miller M, et al. *Circulation*. 2011;123:2292-2333. Grundy SM. Atlas of atherosclerosis and metabolic syndrome. 2005.

HTG by Age, Sex and Ethicity

(US National Health & Nutrition Examination Survey—NHANES, 1999-2008)

Demographic	Triglyceride Cut Points, mg/dL ≥150	≥200	≥500
Overall (age ≥20 y)	31.0	16.2	1.1
Age, y			
20–29	20.7	9.5	0.8
30–39	25.8	14.1	0.7
40–49	32.8	16.7	1.6
50–59	36.7	20.1	1.8
60–69	41.6	22.6	1.0
≥70	34.5	17.2	0.5
Sex			
Men	35.4	19.8	1.8
Women*	26.8	12.7	0.5
Ethnicity			
Mexican American	34.9	19.5	1.4
Non-Hispanic, black	15.6	7.6	0.4
Non-Hispanic, white	33.0	17.6	1.1

%HTG ↑ w/ ↑ Age

Miller M, et al. *Circulation*. 2011;123:2292-333.

Table 1 Classification of fasting triglyceride concentration (mg/dL) by guideline[2,5–7]

NCEP ATP III	Normal <150	Borderline 150–199	High 200–499	Very high ≥500	
AHA 2011	Normal <150	Borderline 150–199	High 200–499	Very high ≥500	
Endocrine Society 2012	Normal <150	Mild HTG 150–199	Moderate HTG 200–999	Severe HTG 1000–1999	Very severe HTG ≥2000
NLA 2014	Normal <150	Borderline 150–199	High 200–499	Very high ≥500	

AHA, American Heart Association; HTG, hypertriglyceridemia; NCEP ATP III, National Cholesterol Education Program Adult Treatment Panel III; NLA, National Lipid Association.

NATIONAL LIPID ASSOCIATION

TABLE 1. Criteria proposed for clinical diagnosis of elevated triglyceride levels under fasting conditions

	NCEP ATP III (3)		The Endocrine Society 2010[a]		
Normal	<150 mg/dl	<1.7 mmol/liter	Normal	<150 mg/dl	<1.7 mmol/liter
Borderline-high triglycerides	150–199 mg/dl	1.7–2.3 mmol/liter	Mild hypertriglyceridemia	150–199 mg/dl	1.7–2.3 mmol/liter
High triglycerides	200–499 mg/dl	2.3–5.6 mmol/liter	Moderate hypertriglyceridemia	200–999 mg/dl	2.3–11.2 mmol/liter
Very high triglycerides	≥500 mg/dl	≥5.6 mmol/liter	Severe hypertriglyceridemia	1000–1999 mg/dl	11.2–22.4 mmol/liter
			Very severe hypertriglyceridemia	≥2000 mg/dl	≥22.4 mmol/liter

[a] The criteria developed for the present guidelines focus on the ability to assess risk for premature CVD *vs.* risk for pancreatitis. The designations of *mild* and *moderate* hypertriglyceridemia correspond to the range of levels predominant in risk assessment for premature CVD, and this range includes the vast majority of subjects with hypertriglyceridemia. Severe hypertriglyceridemia carries a susceptibility for intermittent increases in levels above 2000 mg/dl and subsequent risk of pancreatitis; very severe hypertriglyceridemia is indicative of risk for pancreatitis. In addition, these levels suggest different etiologies. Presence of mild or moderate hypertriglyceridemia is commonly due to a dominant underlying cause in each patient, whereas severe or very severe hypertriglyceridemia is more likely due to several contributing factors.

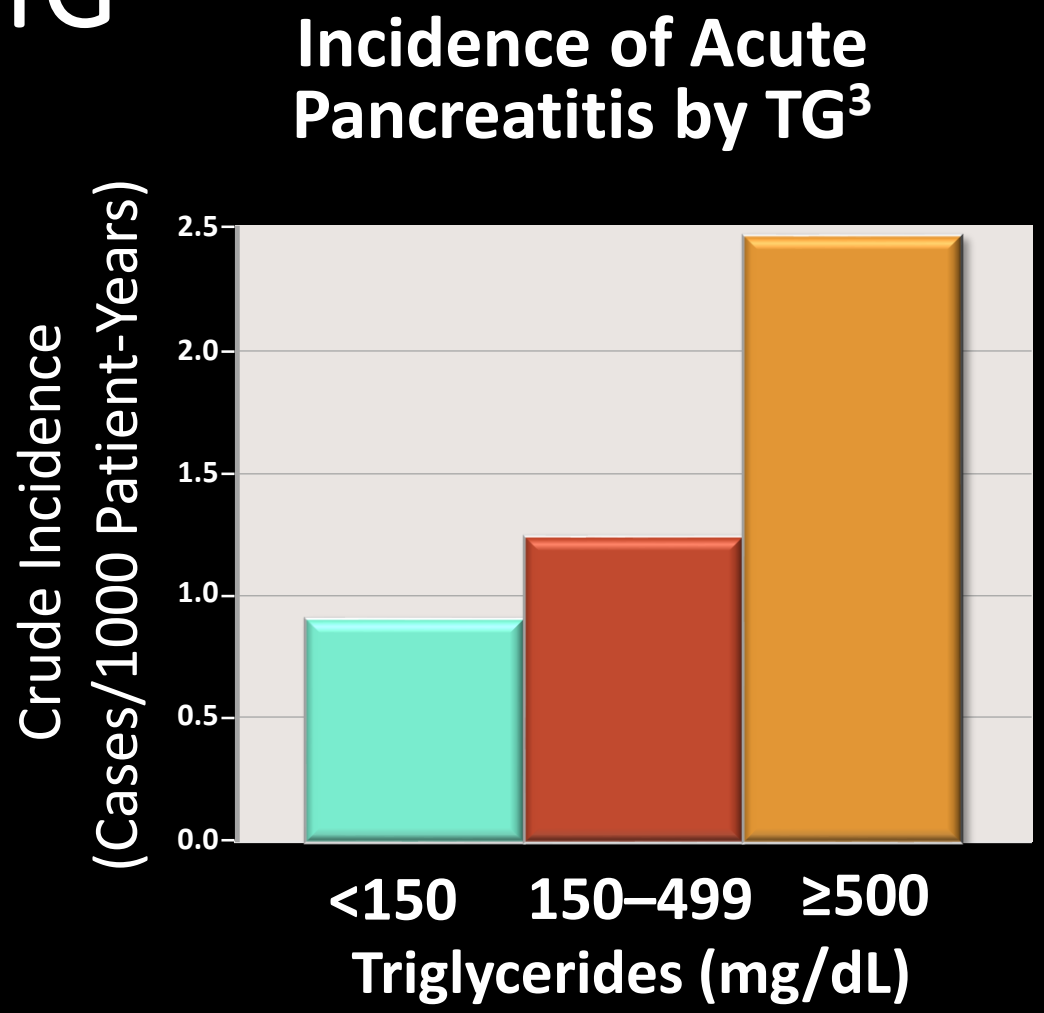
Pancreatitis vs HTG

- HTG is the 3rd biggest cause of acute pancreatitis (~10%) after alcohol & gallstones[1,2]
- Acute pancreatitis risk ↑4%/100 mg/dL ↑ TG* (HR, 1.04)[3]



*After adjustment for covariates and removal of patients hospitalized for gallstones, chronic pancreatitis, alcohol-related morbidities, renal failure, and other biliary disease.

A Report of the American College of Cardiology/American Heart Association Task Force on Clinical Practice Guidelines

Recommendations for Measurements of LDL-C and Non–HDL-C

Referenced studies that support recommendations are summarized in Online Data Supplement 1.

COR	LOE	Recommendations
I	B-NR	1. In adults who are 20 years of age or older and not on lipid-lowering therapy, measurement of either a fasting or a nonfasting plasma lipid profile is effective in estimating ASCVD risk and documenting baseline LDL-C (S2.2-1–S2.2-6).
I	B-NR	2. In adults who are 20 years of age or older and in whom an initial nonfasting lipid profile reveals a triglycerides level of 400 mg/dL (≥4.5 mmol/L) or higher, a repeat lipid profile in the fasting state should be performed for assessment of fasting triglyceride levels and baseline LDL-C (S2.2-1–S2.2-4).

Cause	Clinically useful details
Diet	↑**Fat**, ↓dietary fiber, ↑glycem index?, **ethanol***
	↑Simple sugars, esp. **fructose** (sucrose, etc.)
Adiposopathy	Especially if with ↑**visceral adiposity**
Diabetes mellitus	Especially if **insulin resistant** and/or **hyperglycemic**
Hypothyroidism	Only if inadequately controlled
Renal disease	**Nephrotic syndrome, ESRD**, glomerulonephritis
Systemic Inflammation	Lupus, rheumatoid arthritis, paraproteinemias, etc.
Other conditions	Pregnancy** (especially 3rd trimester)
Medications	**Antiretroviral agents** (for HIV), asparaginase (for leukemia) **2nd-generation anti-Ψ**, phenothiazines, anti-seizure meds Nonselective beta-blockers & thiazide diuretics Bile-acid sequestrants **Oral contraceptives**, oral hormone replacemt.**, tamoxifen **Glucocorticoids, isotretinoin**
Recreational drugs	**Ethanol***, marijuana (↑ApoC-III)

HEREDITARY CAUSES OF HYPERTRIGLYCERIDEMIA

- Primary hypertriglyceridemia
  - Familial Combined Hyperlipidemia (FCHL)
  - Familial Hypertriglyceridemia (FHTG)
  - Familial Dysbetalipoproteinemia (Type III)
  - Familial Chylomicronemia (Type I)
  - Familial Hypoalphalipoproteinemia (FHA)

MANAGEMENT

- Lifestyle modifications is mandatory!!!
- Diet
  - Reduction of carbohydrates, especially high glycemic and high fructose foods.
  - Hypocaloric diet with a goal of weight loss
  - The diet should restrict consumption of high glycemic index/load foods as well as refined sugars, fruit juices, and high fructose beverages
  - Alcohol
    - No more than 2 drinks per day: men
    - No more than 1 drink per day: women

1) Address non-dietary secondary causes of hypertriglyceridemia including medications and conditions such as uncontrolled diabetes, renal disease and hypothyroidism.
2) Refer to a Registered Dietitian/Nutritionist.

General Dietary Pattern

Consume a dietary pattern that emphasizes intake of vegetables, fruits, and whole grains; includes low-fat dairy products, poultry, fish, legumes, non-tropical vegetable oils, nuts, seeds; and limits intakes of sweets, sugar–sweetened beverages and high fat meats.

	Borderline 150–199 mg/dL	**High** 200–499 mg/dL	**Very High** 500–999 mg/dL	**Very High** ≥1000 mg/dL with chylomicronemia[a]
Weight Loss	← 5–10% →			
Added Sugars[b]	<10%	<10%	<5%	Near 0%
Total Fat	25–35%	30–35%	20–35%	10–15%
SFA	<7%	<7%	<7%	<3%
EPA+DHA	0.25–2 g/day	1–2 g/day	2-4 g/day	3-4 g/day
Alcohol	Moderate or Less	Moderate or Less	Eliminate	Eliminate
Aerobic Activity	← ≥5x per week →			
		Pharmacologic therapy if needed to attain LDL-C and non-HDL-C goals	*Pharmacologic therapy to lower TG for pancreatitis prevention as the primary objective*	

Monitor to determine response to intervention

Continue intervention or adjust as indicated

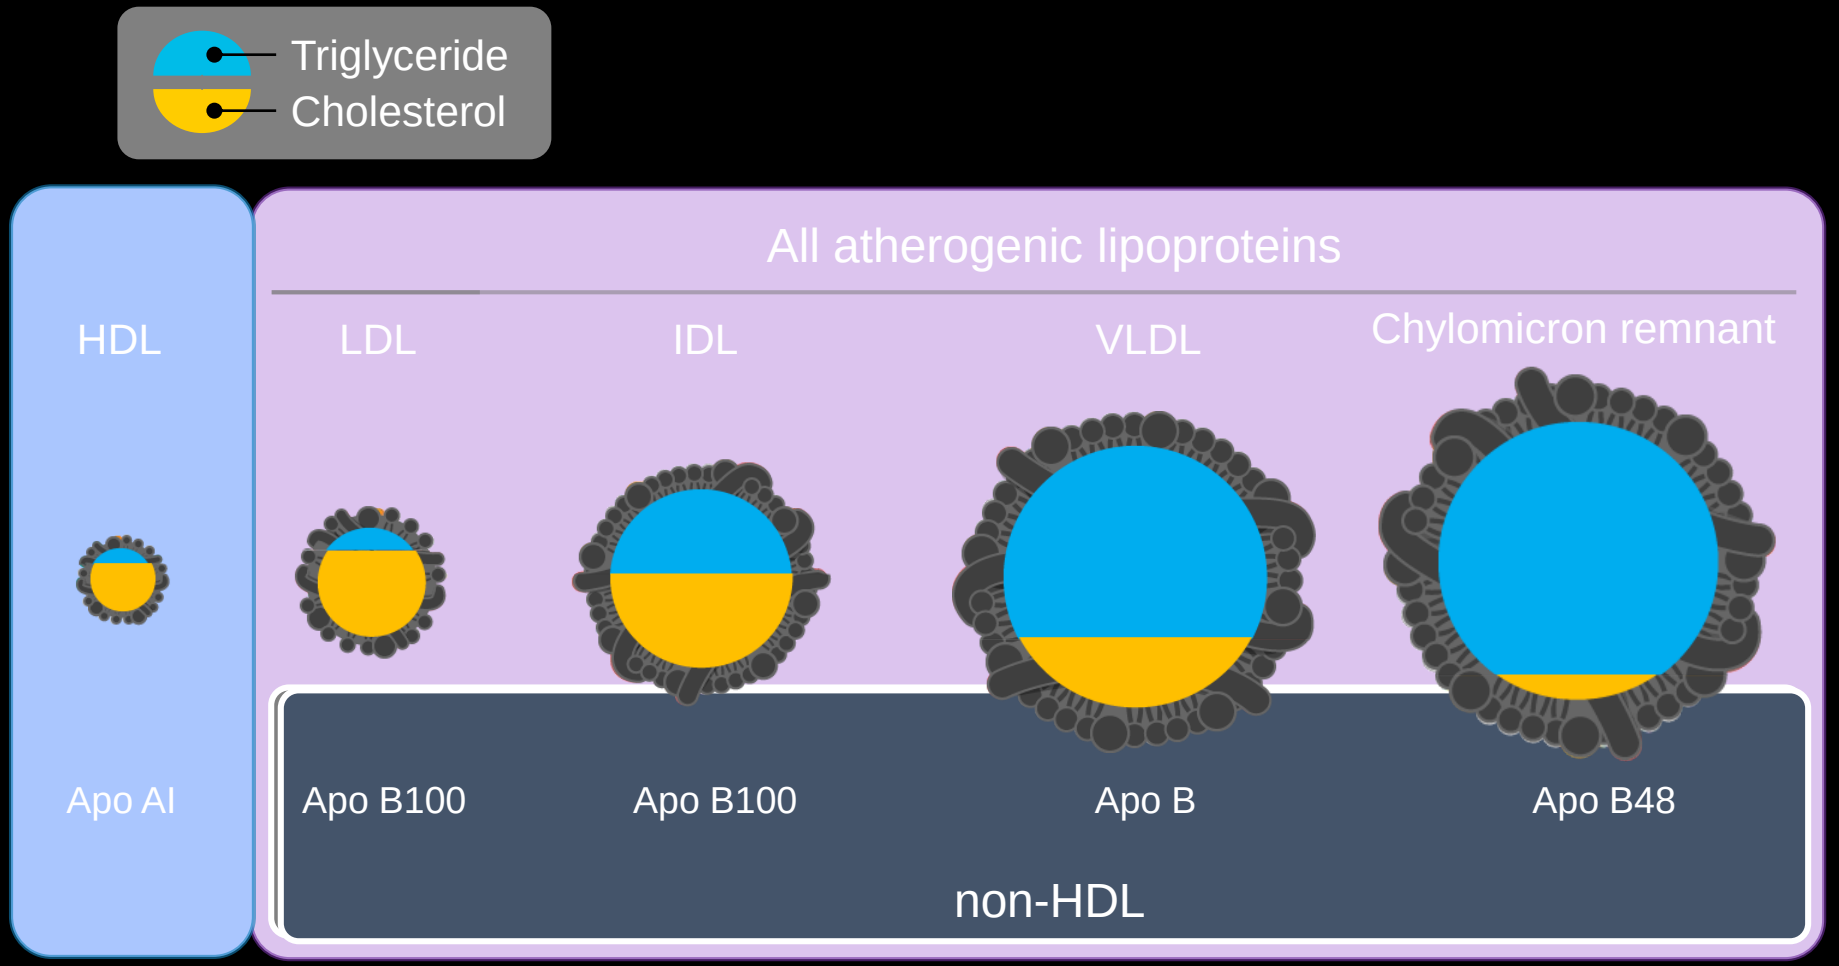
Moderate Hypertriglyceridemia

MODERATE HYPERTRIGLYCERIDEMIA 200-999 ng/dL

- 3.3.”We recommend that the treatment goal for patients with moderate hypertriglyceridemia be a non-HDL cholesterol level in agreement with NCEP ATP guidelines”

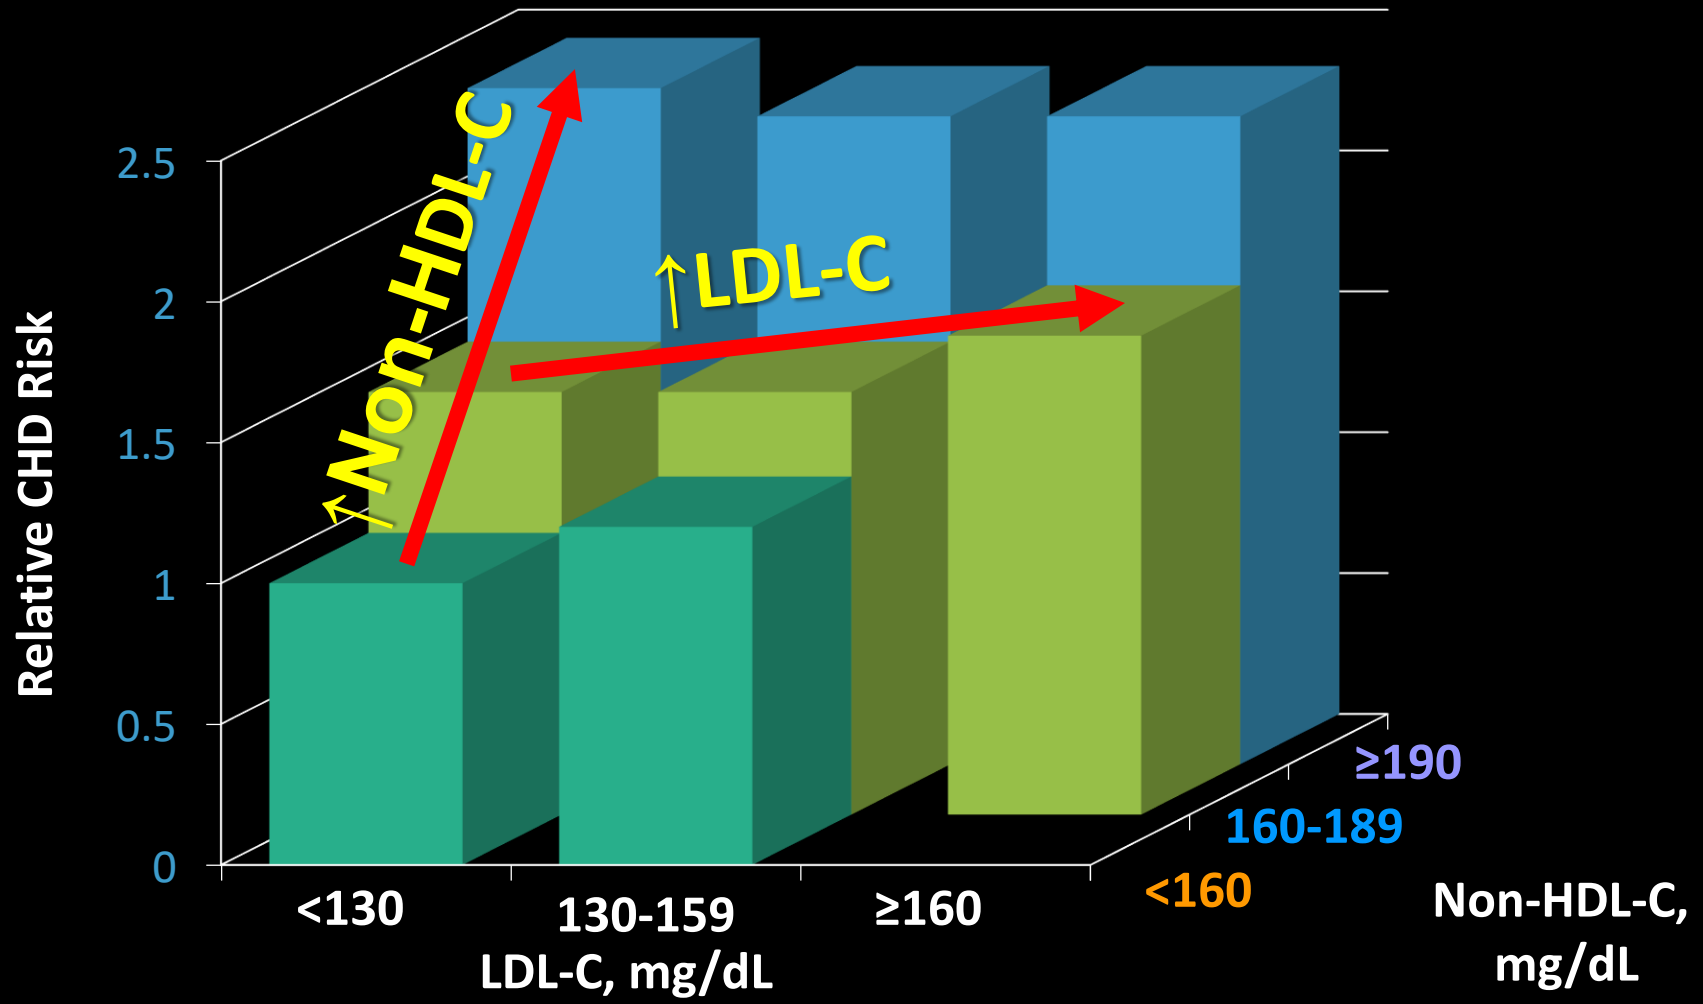
J Clin Endocrinol Metab, September 2012, 97(9):2969–2989

What is Non-HDL-C?



Non-HDL-C = Total cholesterol – HDL-C

Non–HDL-C Is Much Stronger than LDL-C in Predicting CHD Risk



Liu J, et al. *Am J Cardiol.* 2006;98:1363-1368. (Framingham Study)

Non-HDL-C: A Neglected CVD Risk Factor/Rx Goal

Whenever TG > 200 mg/dL:

1. Non-HDL-C = Total C – HDL-C (*all* atherogenic lip)
2. Non-HDL-C goal = LDL-C goal + 30:

Patient Category	LDL-C Goal (mg/dL)	Non–HDL-C Goal (mg/dL)
CVD (DM+MRF?)	<70	<100
FRS >20%, CHD-RE	<100	<130
FRS 5-20%, 2+ RFs	<130	<160
No CHD, 0-1 RFs	<160	<190

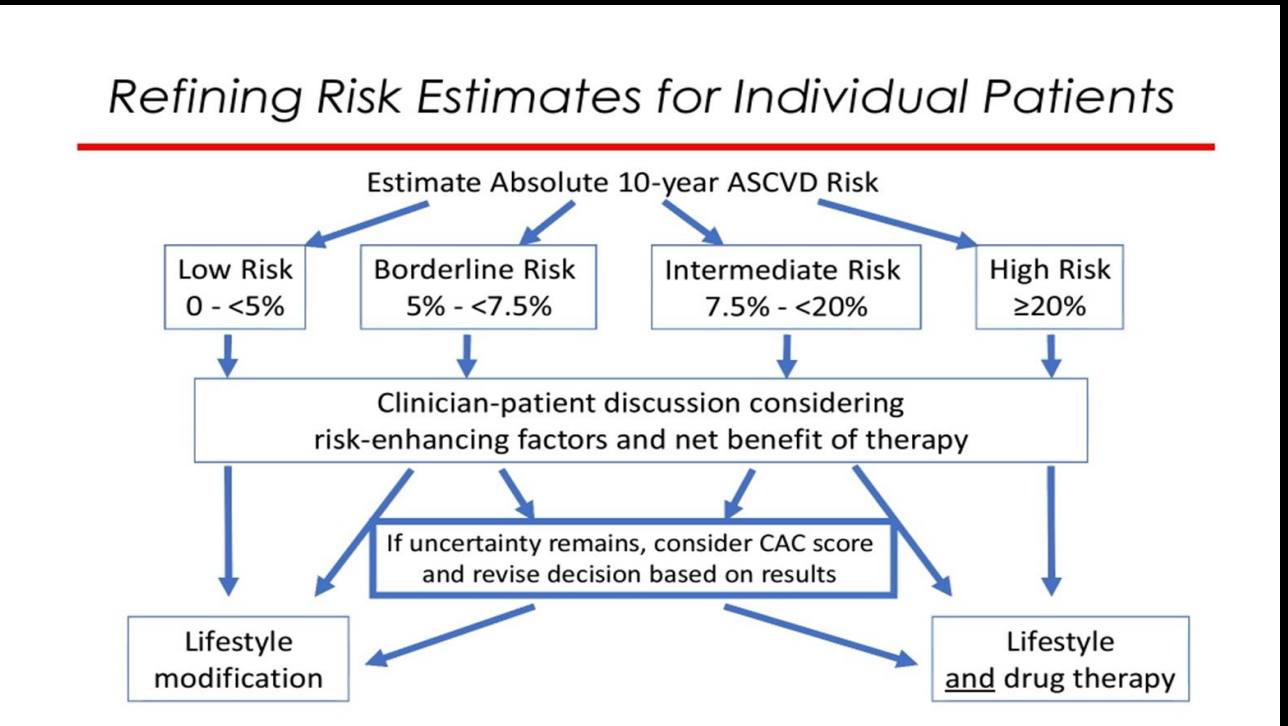
RF= CVD risk factors.

Adapted from ATP-III. *JAMA*. 2001;285:2486-2497; Grundy SM et al. *Circulation*. 2004;110:227-239.

The National Lipid Association reaffirmed similar lipid goals. Jacobson, T. *J Clin Lipid.* 2014;8:473–488.

Moderate Hypertriglyceridemia 200-500 ng/dL

- Therefore, if an adult patient with moderate hypertriglyceridemia has poorly controlled major risk factors for ASCVD and a 10-year risk of ASCVD ≥7.5% by the PCE, it is reasonable to either initiate or intensify statin therapy



Grundy SM, et al.
2018 Cholesterol Clinical Practice Guidelines

Moderate Hypertriglyceridemia 175-499 ng/dL

- 10.27 “ In adults with moderate hypertriglyceridemia (fasting or non-fasting triglycerides 175–499 mg/dL), clinicians should address and treat lifestyle factors (obesity and metabolic syndrome), secondary factors (diabetes, chronic liver or kidney disease and/or nephrotic syndrome, hypothyroidism), and medications that raise triglycerides”

American Diabetes Association®

Diabetes Care Volume 42, Supplement 1, January 2019

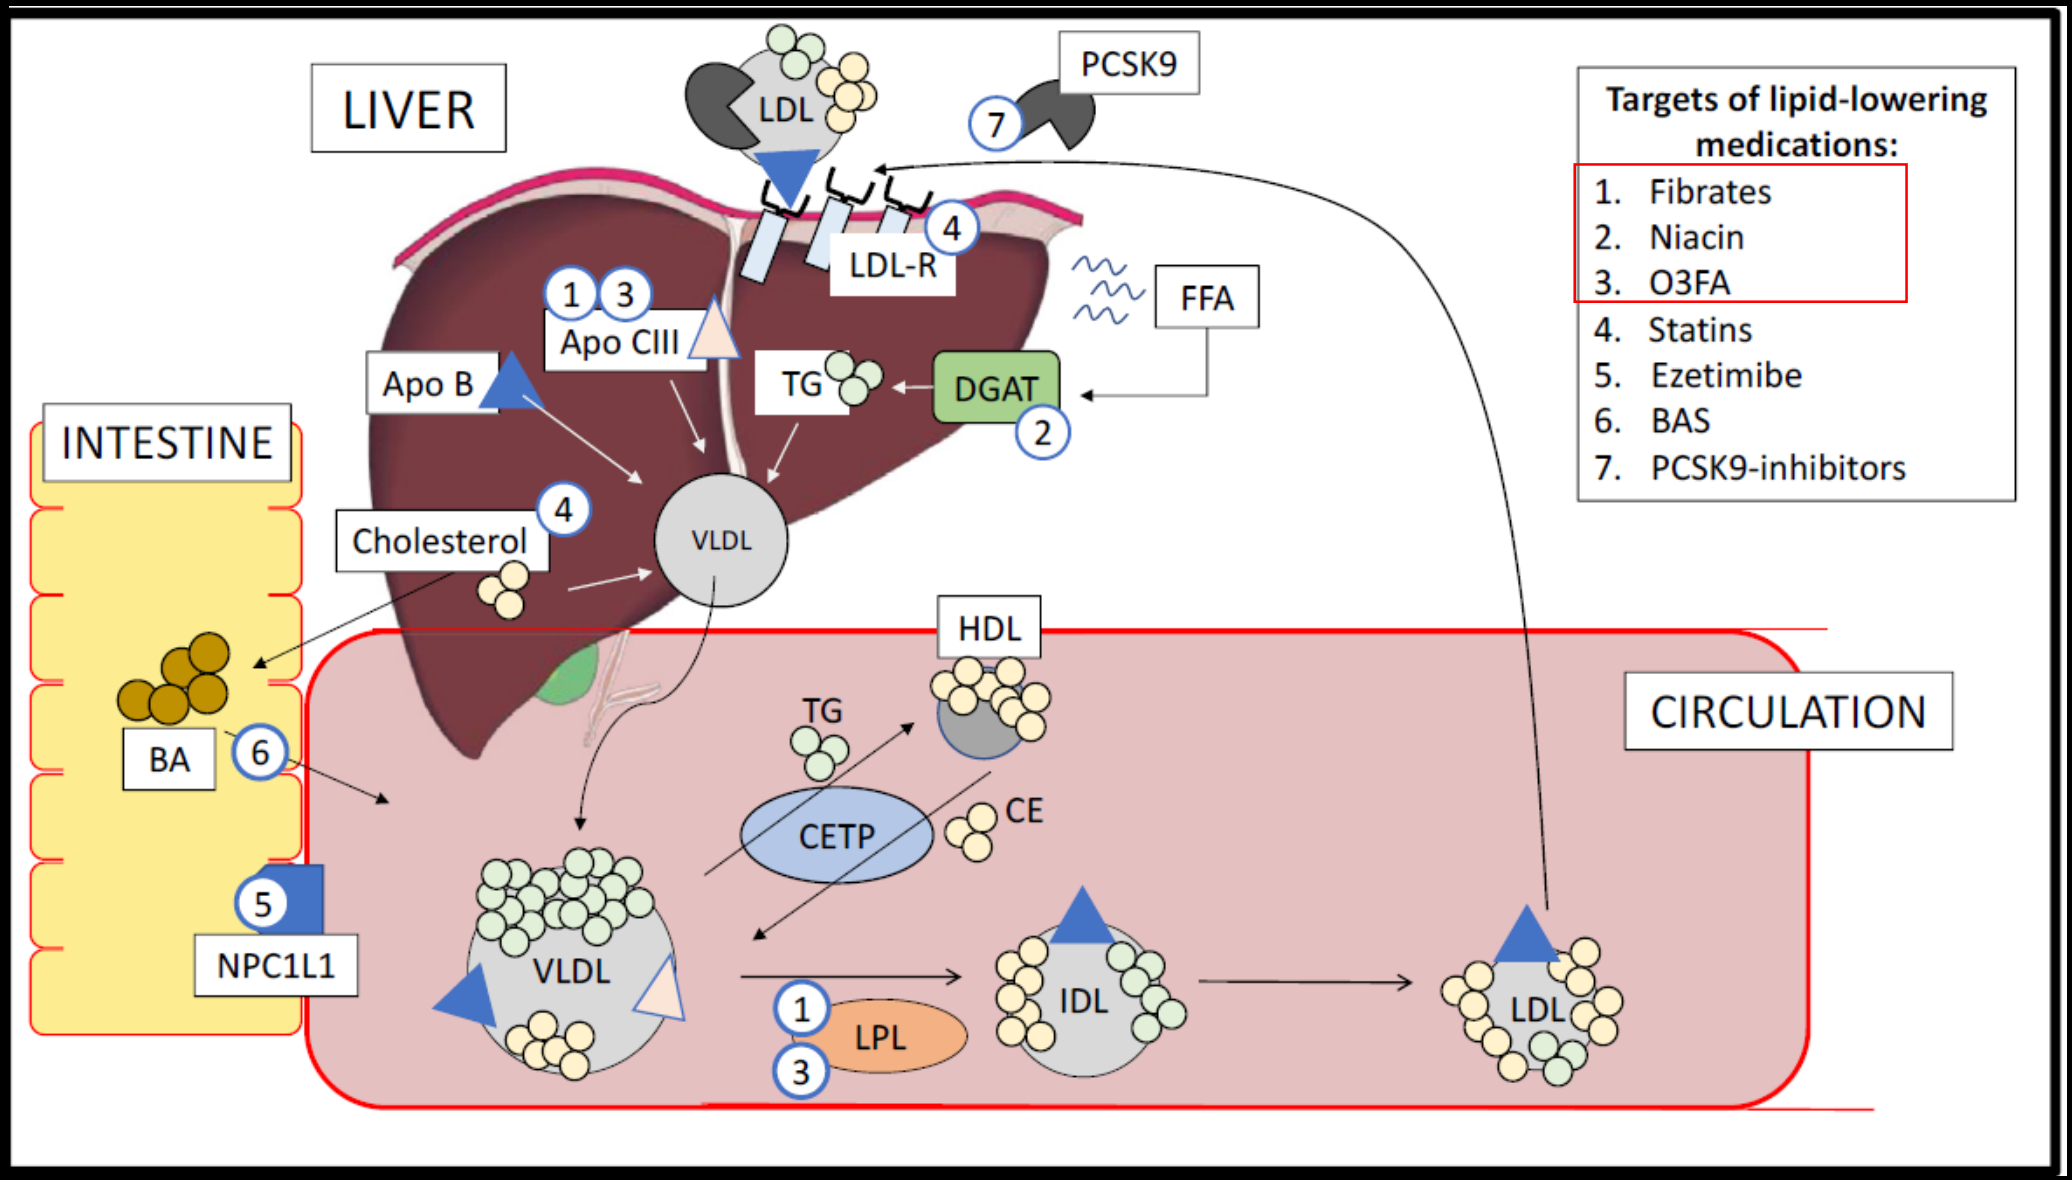
TG Lowering Medications: When? Which?

TG-Lowering Effect by Drug Class

Drug	TG Reduction
Fibrates	30% – 50%
Omega-3	20% – 50%
Immediate-release niacin	20% – 50%
Extended-release niacin	10% – 30%
Statins	10% – 30%
Ezetimibe	5% – 10%

TG reduction values are not always corrected for baseline TG levels. Given that the greatest reduction in TG levels occur in those with the highest TG levels at baseline, this may not be a fair assessment of the TG-lowering effect of lipid-altering drugs in HTG patients.

Miller M et al. *Circulation*. 2011;123:2292-333.



Journal of Clinical Lipidology (2017) 11, 872–879

Fenofibrate Formulations:
Available Fenofibrate Doses (mg/day)

Regular dose	Reduced dose*	Brand Name
200	67**	Lofibra®
160	54/50	Lofibra®/Triglide®
120	40	Fenoglide®
90	30	Antara®

8 Brand Names,
8 Degrees of micronization/bioavailability
16 separate dosages!

Bottom line: pick the one that works best for your patient's payer

*primarily for renal or geriatric patients
** also available at 134 mg
***fenofibric acid
(See FDA-approved prescribing information for further details)

Fibrates Mechanism of Action

Decrease VLDL synthesis

- PPAR alpha activation for stimulation of beta oxidation of fatty acids

Increasing clearance TGs rich lipoproteins

- PPAR alpha activation of the peripheral lipoprotein lipase
- Also PPAR alpha activation promotes apo-CIII inhibition.

Fibrate Trials Summary

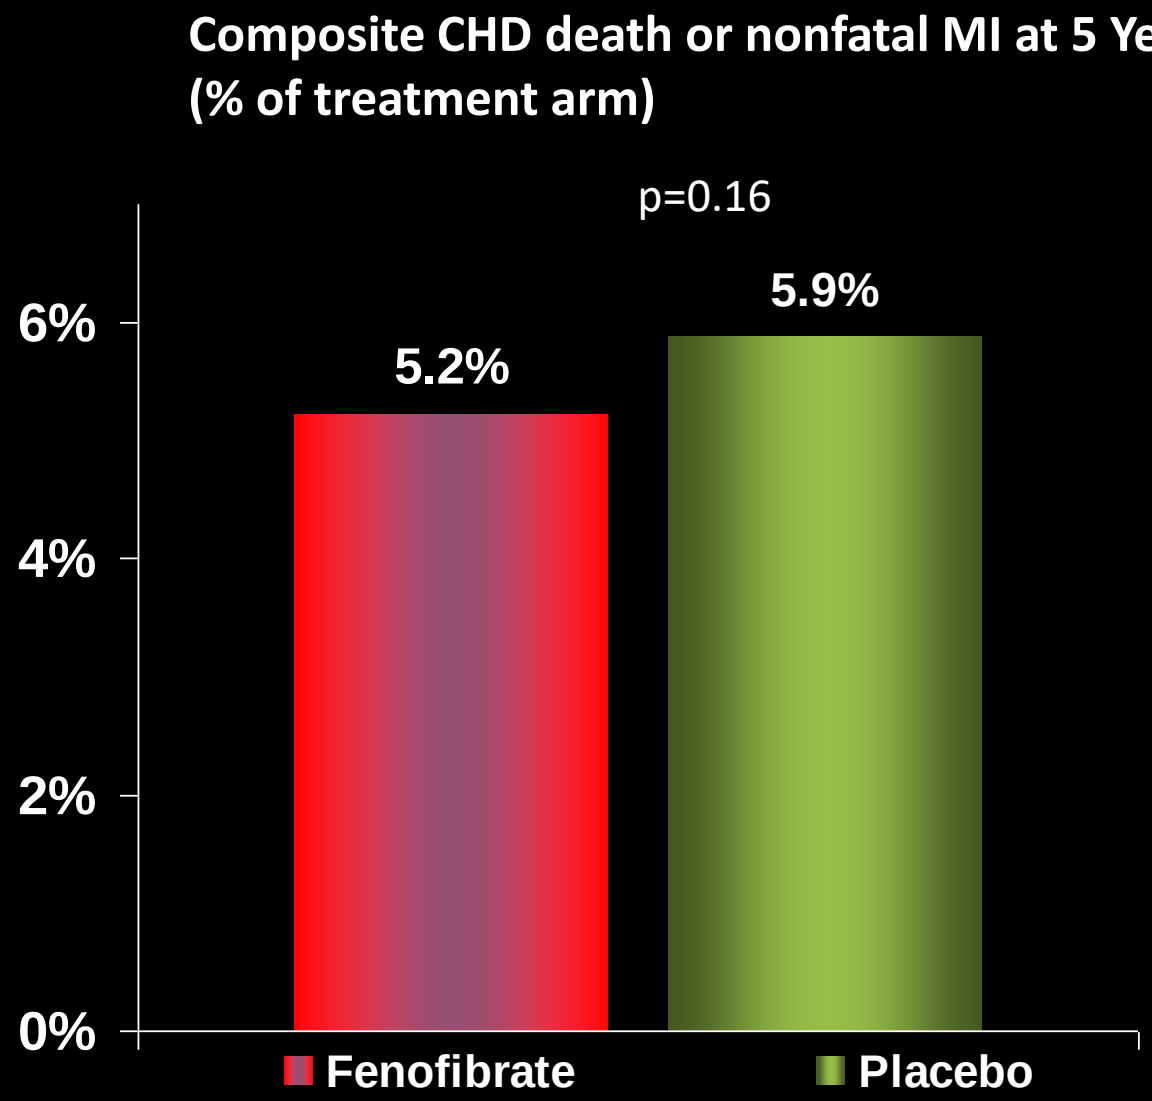
Trial	N	Therapy	Primary Endpoint
ACCORD Lipid[a]	5518	Fenofibrate vs placebo (simvastatin background)	Non-fatal MI or stroke, death from CV cause
FIELD[b]	9795	Fenofibrate vs placebo	CVD event rates
BIP[c]	3090	Bezafibrate vs placebo	Mortality
HHS[d]	6126	Gemfibrozil vs placebo	CHD risk
VA-HIT[e]	2531	Gemfibrozil vs placebo	CHD events

Dyslipidemia: TG ≥ 204mg/dL, HDL-C ≤ 34 mg/dL
Complementary subgroups: TG < 204 mg/dL, HDL-C > 34 mg/dL

Odds ratio ↓ 35% in dyslipidemia[f]

a.ACCORD Study Group, et al. *N Engl J Med*. 2010;362:1563-1574[19]; b. Scott R, et al. *Diabetes Care*. 2010;363:692-694[17]; c. BIP Study Group. *Circulation*. 2000;102:21-27[15]; d. Manninen V, et al. *Circulation*. 1992;85:37-45[14]; e. Robins SJ, et al. *JAMA*. 2001;285:1585-1591[16]; Sacks FM, et al. *N Engl J Med*. 2010;363:692-694.[18]

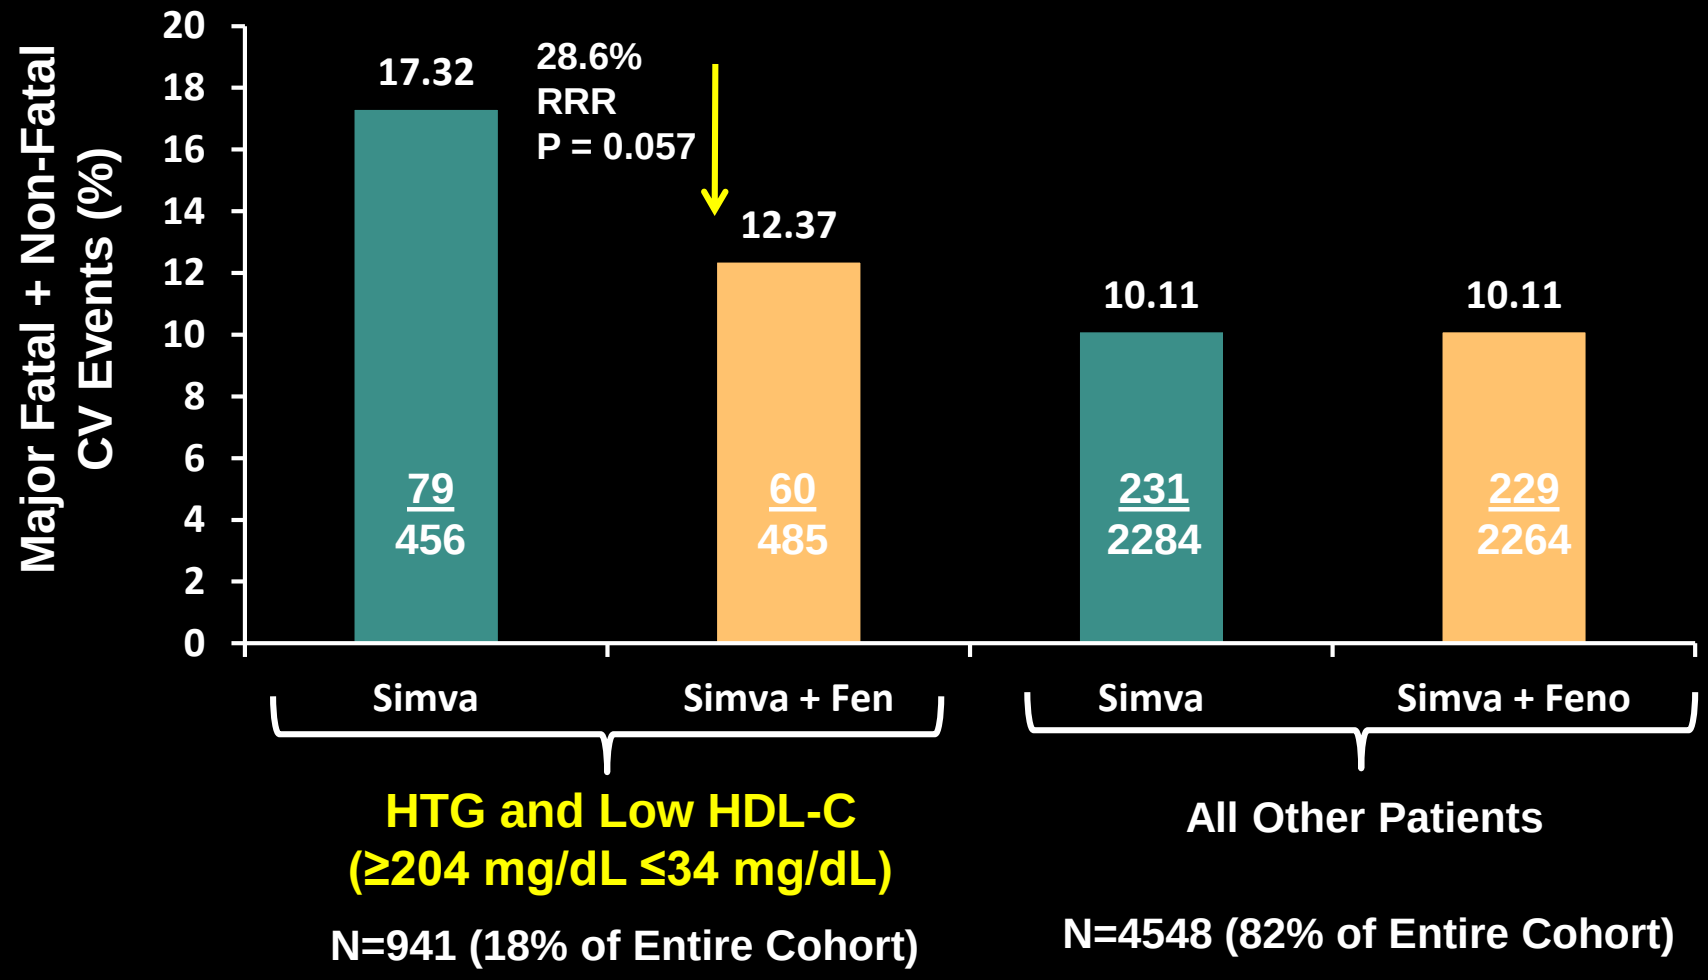
FIELD: Primary Endpoint



- The primary composite endpoint of CHD death or non-fatal MI was not significantly lower in the fenofibrate group compared to the placebo group.

The FIELD study investigators. Effects of long-term fenofibrate therapy on cardiovascular events in 9795 people with type 2 diabetes mellitus (the FIELD study): randomised controlled trial. Lancet. 2005.366:1849-1861

ACCORD-Lipid: *Entire* ASCVD Benefit w/ Fenofibrate in HTG/Low HDL-C

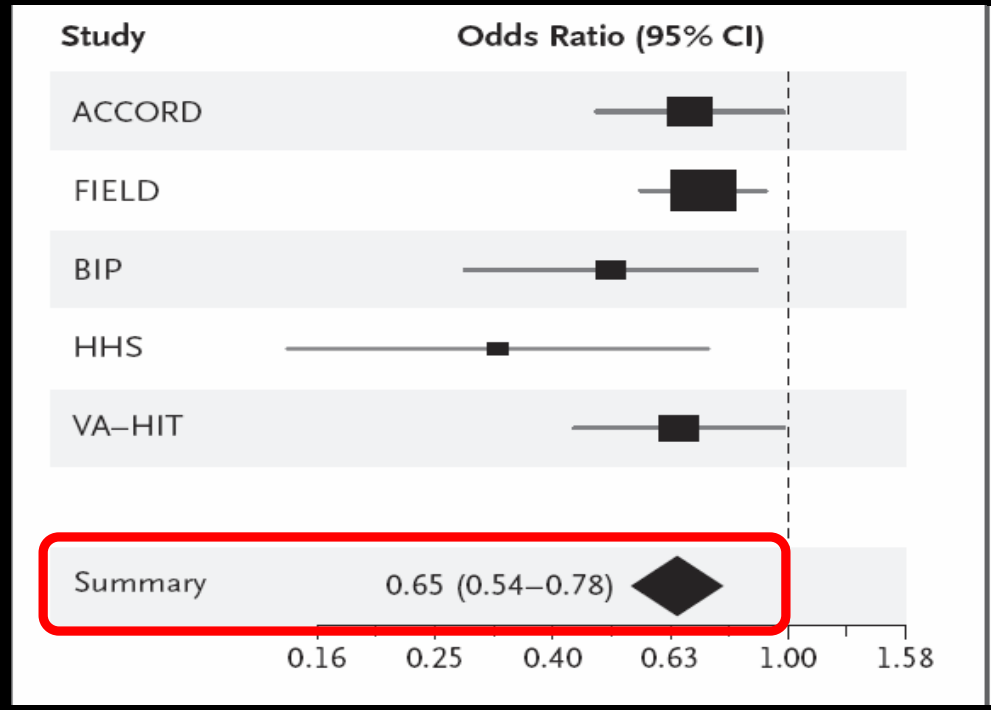


Ginsberg HN for the ACCORD Study Group. *N Engl J Med*. 2010;362:1563-74. Prespecified analysis.

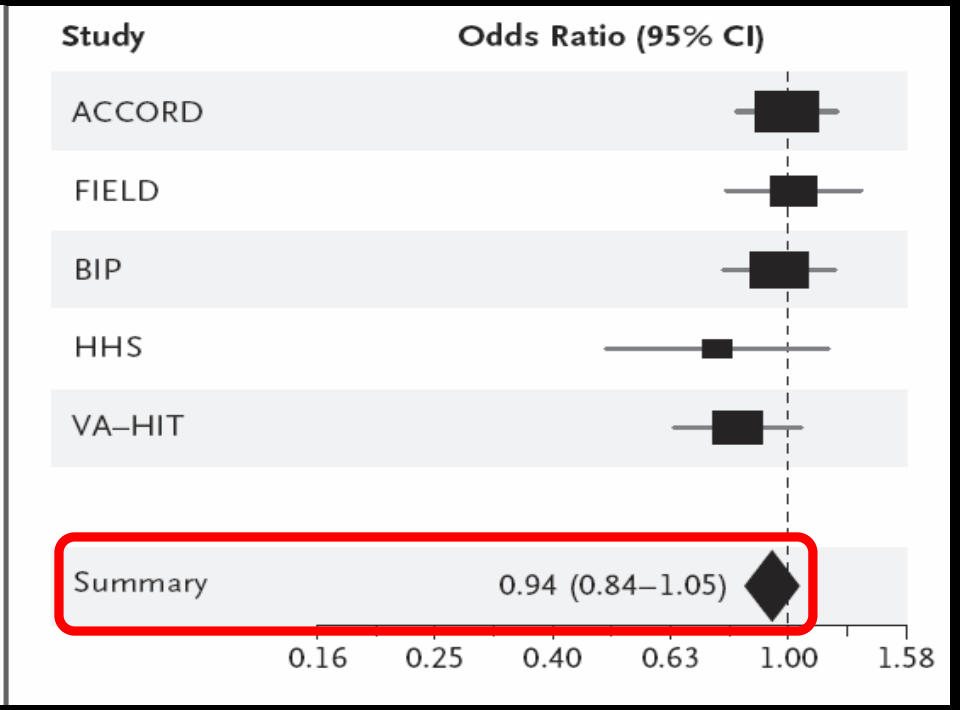
Fibrates Reduce CHD Risk ~35% in Patients with High TG and Low HDL-C

A meta-analysis of randomized fibrate trials

A **Subjects *with* Dyslipidemia**



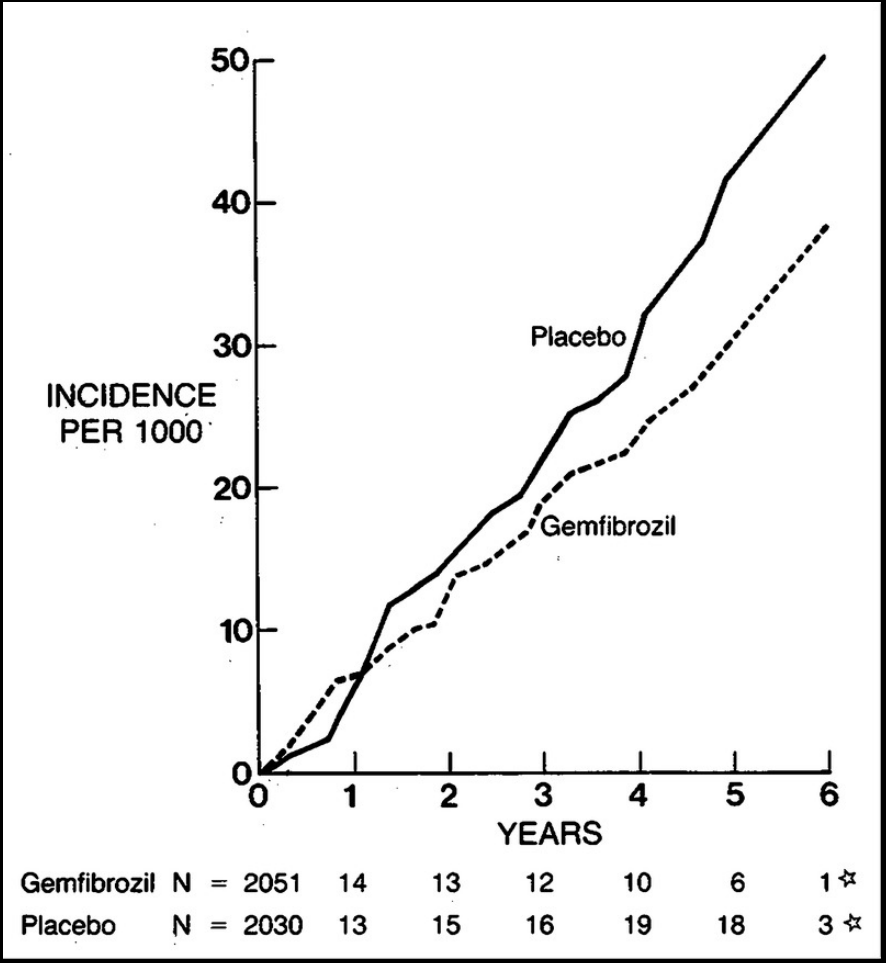
B **Subjects *without* Dyslipidemia**



"With Dyslipidemia"= TG ≥ 204mg/dL and HDL-C ≤ 34mg/dL

After Sacks FM, Carey VJ, Fruchart JC. *N Engl J Med.* 2010;363(7):692-694.

HELSINSKY HEART STUDY

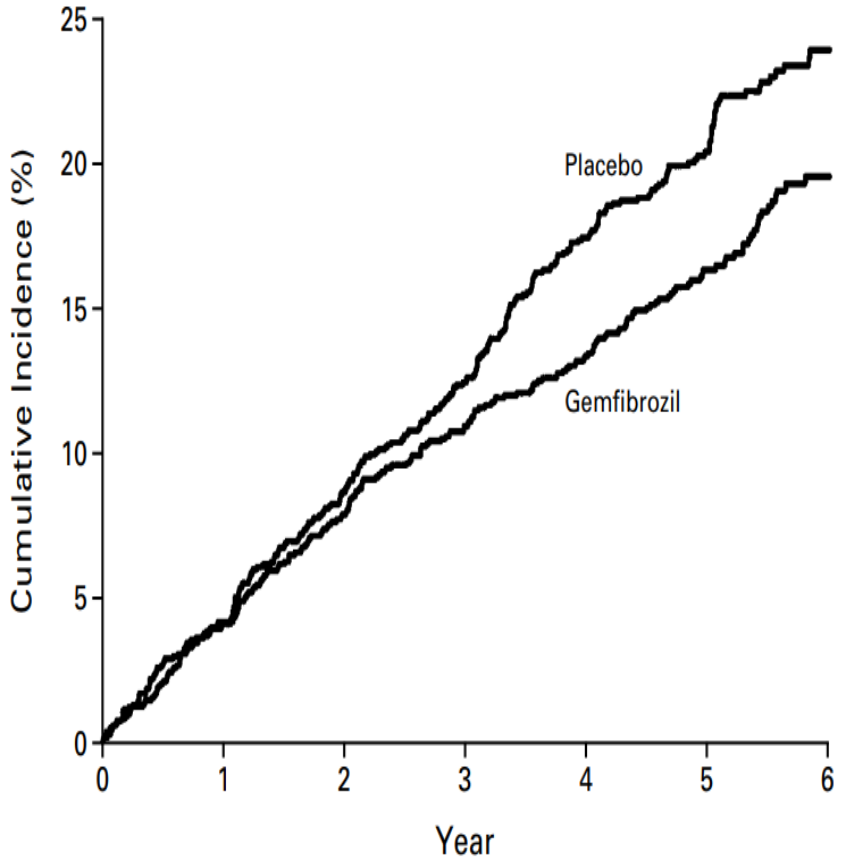


5 year trial that tested efficacy of gemfibrozil for decreasing the risk of coronary artery disease in hypercholesterolemia men without coronary artery disease

The study involved men (40 to 55 years of age) with a non-HDL level > 200 mg/dL (242)

Gemfibrozil was associated with a 34% reduction in coronary artery events

Frick et al. N Engl J Med 1987; 317:1237-1245



No. at Risk

Placebo	1267	1200	1118	1040	962	666	466
Gemfibrozil	1264	1201	1128	1067	1005	706	498

Figure 2. Kaplan–Meier Estimates of the Incidence of Death from Coronary Heart Disease and Nonfatal Myocardial Infarction in the Gemfibrozil and Placebo Groups.

The relative risk reduction was 22 percent (P=0.006), as derived from a Cox model.

Table 2. Major Cardiovascular Events According to Treatment Group.*

Event	Placebo (N=1267)	Gemfibrozil (N=1264)	Risk Reduction (95% CI)	P Value
	no. (%)		%	
Nonfatal myocardial infarction or death due to CHD	275 (21.7)	219 (17.3)	22 (7 to 35)	0.006
Nonfatal myocardial infarction or death due to CHD (excluding silent myocardial infarction)	241 (19)	195 (15.4)	21 (4 to 34)	0.02
Nonfatal myocardial infarction, death due to CHD, or confirmed stroke†	330 (26)	258 (20.4)	24 (11 to 36)	<0.001
Nonfatal myocardial infarction	184 (14.5)	146 (11.6)	23 (4 to 38)	0.02
Death due to CHD	118 (9.3)	93 (7.4)	22 (−2 to 41)	0.07
Death from any cause	220 (17.4)	198 (15.7)	11 (−8 to 27)	0.23
Investigator-designated stroke	88 (6.9)	64 (5.1)	29 (2 to 48)	0.04
Confirmed stroke	76 (6.0)	58 (4.6)	25 (−6 to 47)	0.10
Transient ischemic attack	53 (4.2)	22 (1.7)	59 (33 to 75)	<0.001
CABG	173 (13.7)	164 (13.0)	6 (−17 to 24)	0.60
PTCA	147 (11.6)	120 (9.5)	21 (−1 to 38)	0.06
CABG or PTCA	287 (22.7)	266 (21.0)	9 (−8 to 23)	0.29
Peripheral vascular surgery	28 (2.2)	19 (1.5)	33 (−20 to 63)	0.18
Carotid endarterectomy	44 (3.5)	16 (1.3)	65 (37 to 80)	<0.001
Hospitalization for unstable angina	453 (35.8)	457 (36.2)	−0.4 (−14 to 12)	0.95
Hospitalization for congestive heart failure	168 (13.3)	134 (10.6)	22 (2 to 38)	0.04

*CI denotes confidence interval, CHD coronary heart disease, CABG coronary-artery bypass graft, and PTCA percutaneous transluminal coronary angioplasty. Relative risk reductions, 95 percent confidence intervals, and P values are derived from Cox models. For risk reductions, negative numbers indicate an increase in risk.

†Confirmed stroke was judged by a blinded adjudication panel of three neurologists.

Gemfibrozil Safety

Class III Recommendation: Harm	Level of Evidence
• Gemfibrozil should not be initiated in patients on statin therapy because of an increased risk for muscle symptoms and rhabdomyolysis	B

- Fenofibrate resulted in a 15 times lower rhabdomyolysis rate than did gemfibrozil

Circulation. 2014;129[suppl2]:S1:S45.
J Clin Lipid. 2014;(3 Suppl):S30-46

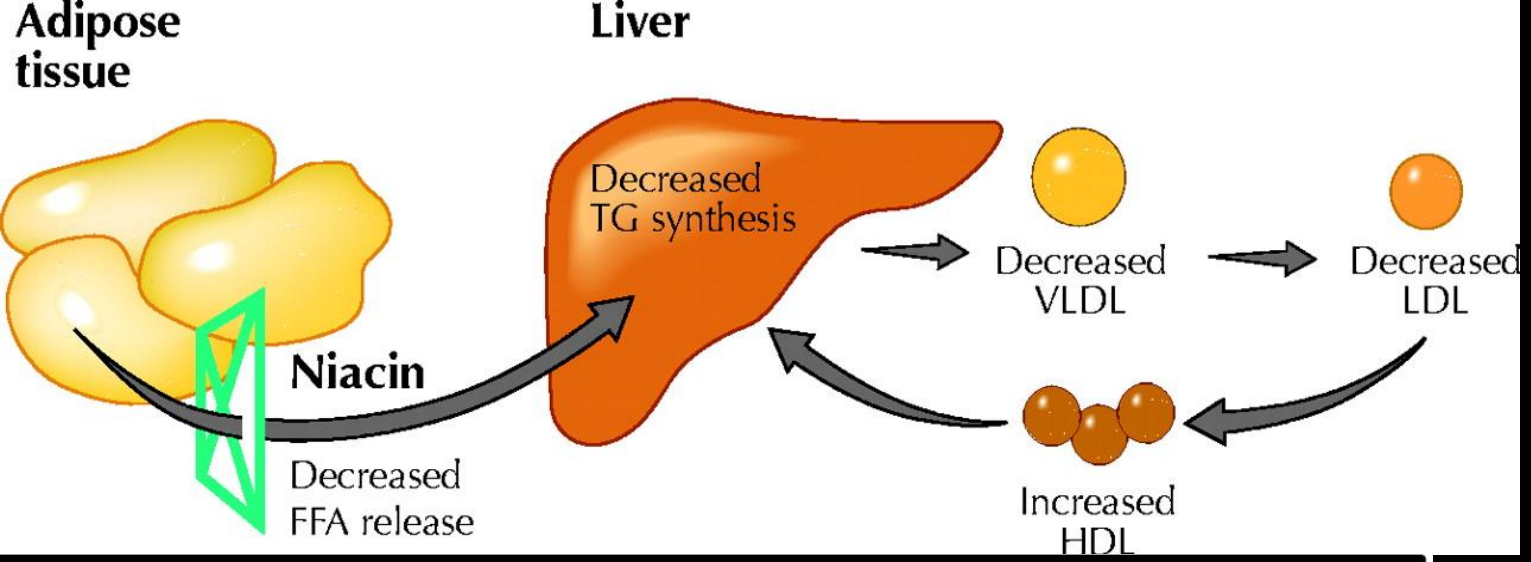
Concomitant medication	Cautions
HMG-CoA Reductase Inhibitors	risk of myopathy and rhabdomyolysis
Anticoagulants	warfarin dosage should be reduced
CYP2C8 Substrates	drugs metabolized CYP2C8 (e.g., dabrafenib, loperamide, montelukast, paclitaxel, pioglitazone, rosiglitazone) may be required to reduce
OATP1B1 substrates	substrates of OATP1B1 (e.g., atrasentan, atorvastatin, bosentan, ezetimibe, fluvastatin, glyburide, SN-38 [active metabolite of irinotecan], rosuvastatin, pitavastatin, pravastatin, rifampin, valsartan, olmesartan) may be required to reduce
Bile Acid-Binding Resins	resin-granule drugs such as colestipol (5 g) are recommended at 2 or more hours apart
Colchicine	myopathy, including rhabdomyolysis in chronic administration of colchicine

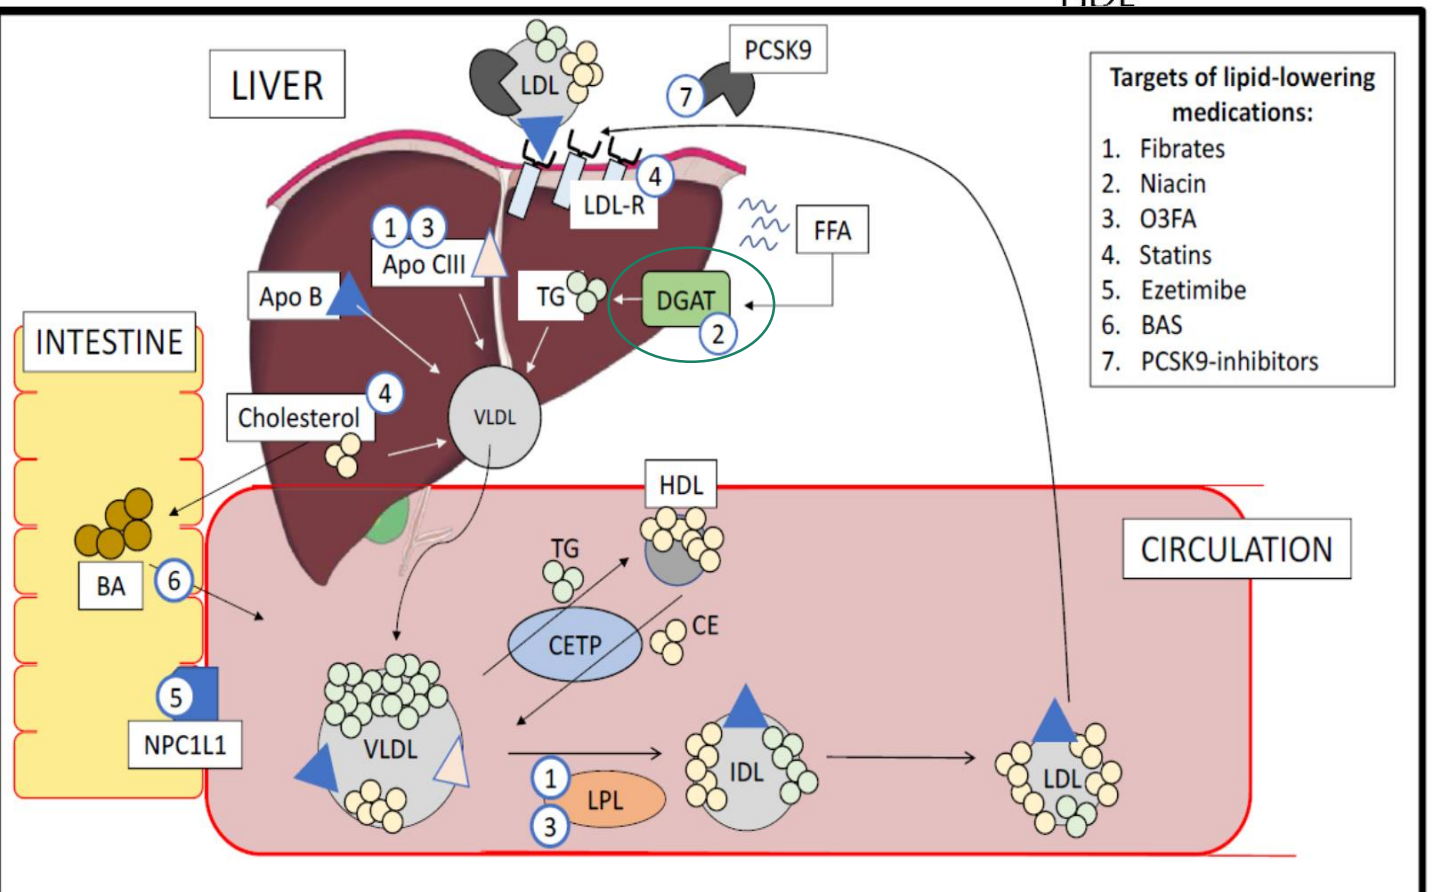
SPC of LOPID issued March.2016

Statin	In combination with gemfibrozil
Atorvastatin	• No dose restriction cited. • Due to increased risk of myopathy/rhabdomyolysis, combination should be avoided.
Fluvastatin	• No dose restriction cited. • Due to increased risk of myopathy/rhabdomyolysis, combination should be avoided.
Lovastatin	• No dose restriction cited. • Due to increased risk of myopathy/rhabdomyolysis, combination should be avoided.
Pitavastatin	• No dose restriction cited. • Due to increased risk of myopathy/rhabdomyolysis, combination should be avoided.
Pravastatin	• No dose restriction cited. • Due to increased risk of myopathy/rhabdomyolysis, combination should be avoided.
Rosuvastatin	• Initiate therapy with 5 mg once daily; the dose should not exceed 10 mg once daily. • Due to increased risk of myopathy/rhabdomyolysis, combination should be avoided.
Simvastatin	• Combination is contraindicated.

Gemfibrozil

Fibrate	Dose based on GFR (mL/min/1.73 m^2)			
	>90	60-90	15-59	<15
Fenofibrate*	High Dose (ex. 200 mg)	Medium Dose (ex. 167 mg)	Low Dose (ex. 67 mg)	AVOID
Gemfibrozil	600 mg Twice daily	600 mg Twice daily	600 mg daily	





NIACIN

- Niacin decreases TG by inhibiting diacylglycerol acyltransferase 2.
- An enzyme that catalyzes the formation of TG from diacylglycerol and acyl-CoA.
- Also inhibits the lipolysis and subsequent release of TG into the circulation.

The NEW ENGLAND JOURNAL of MEDICINE

ESTABLISHED IN 1812 DECEMBER 15, 2011 VOL. 365 NO. 24

Niacin in Patients with Low HDL Cholesterol Levels Receiving Intensive Statin Therapy

The AIM-HIGH Investigators*

N Engl J Med 2011;365:2255-67.

Table 4. Primary, Secondary, and Tertiary End Points.

End Point			Hazard Ratio with Niacin (95% CI)	P Value*
Primary end point: deatl myocardial infar for acute corona nary or cerebral			1.02 (0.87–1.21)	0.80
Individual primary-end-				
Death from coronar				
Nonfatal myocardial				
Ischemic stroke				
Hospitalization for a				
Symptom-driven cor				
Secondary end points				
Death from coronar infarction, high- ischemic stroke			1.08 (0.87–1.34)	0.49
Death from coronary heart disease, nonfatal myocardial infarction, or ischemic stroke	138 (8.1)	156 (9.1)	1.13 (0.90–1.42)	0.30
All deaths from cardiovascular causes	38 (2.2)	45 (2.6)	1.17 (0.76–1.80)	0.47

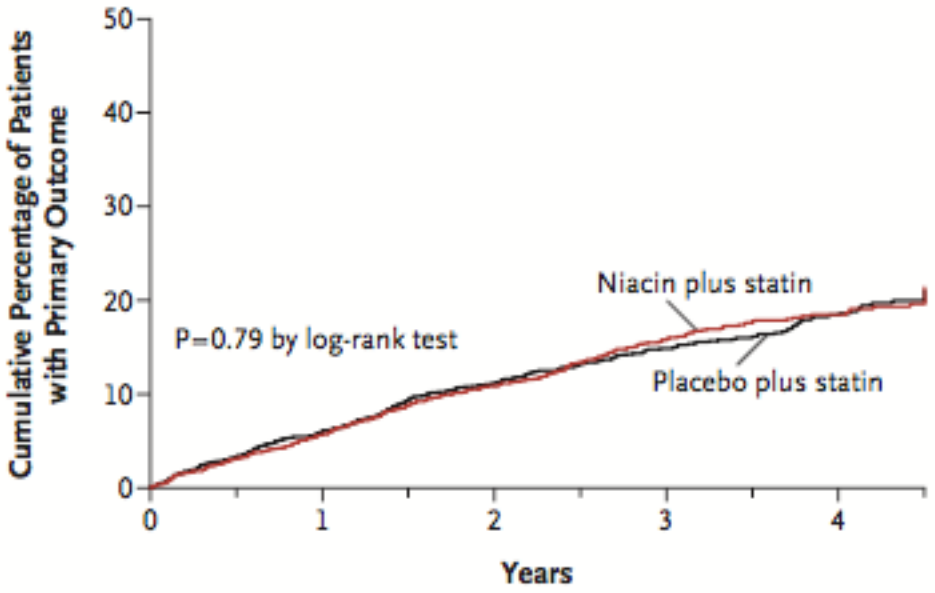


Figure 1. Kaplan–Meier Curve for the Primary End Point.

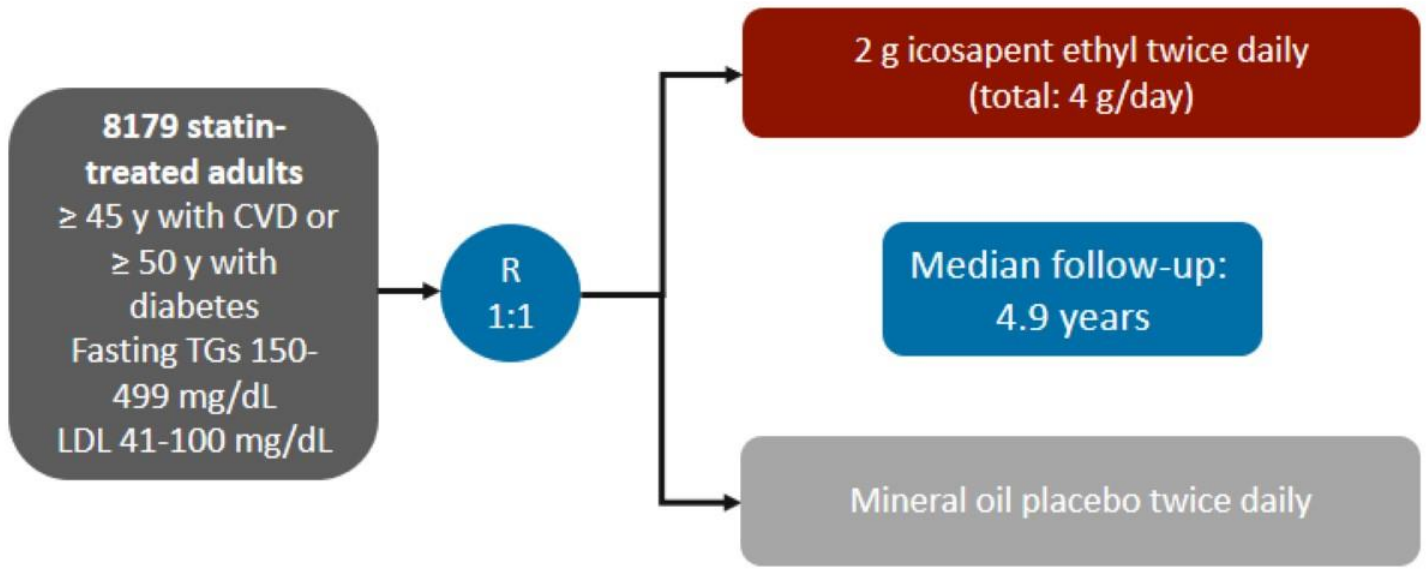
on Behalf of the REDUCE-IT Investigators

REDUCE-IT
Study Design

Phase 3b, double-blind, multicenter, randomized, placebo-controlled trial in statin-treated patients with established CVD or with diabetes



- Primary efficacy endpoint: composite of CV death, nonfatal MI,* nonfatal stroke, coronary revascularization, UA
- Key secondary endpoint: composite of CV death, nonfatal MI,* or nonfatal stroke

*Including silent MI.

Bhatt DL, et al. *N Engl J Med.* 2019;380:11-22.

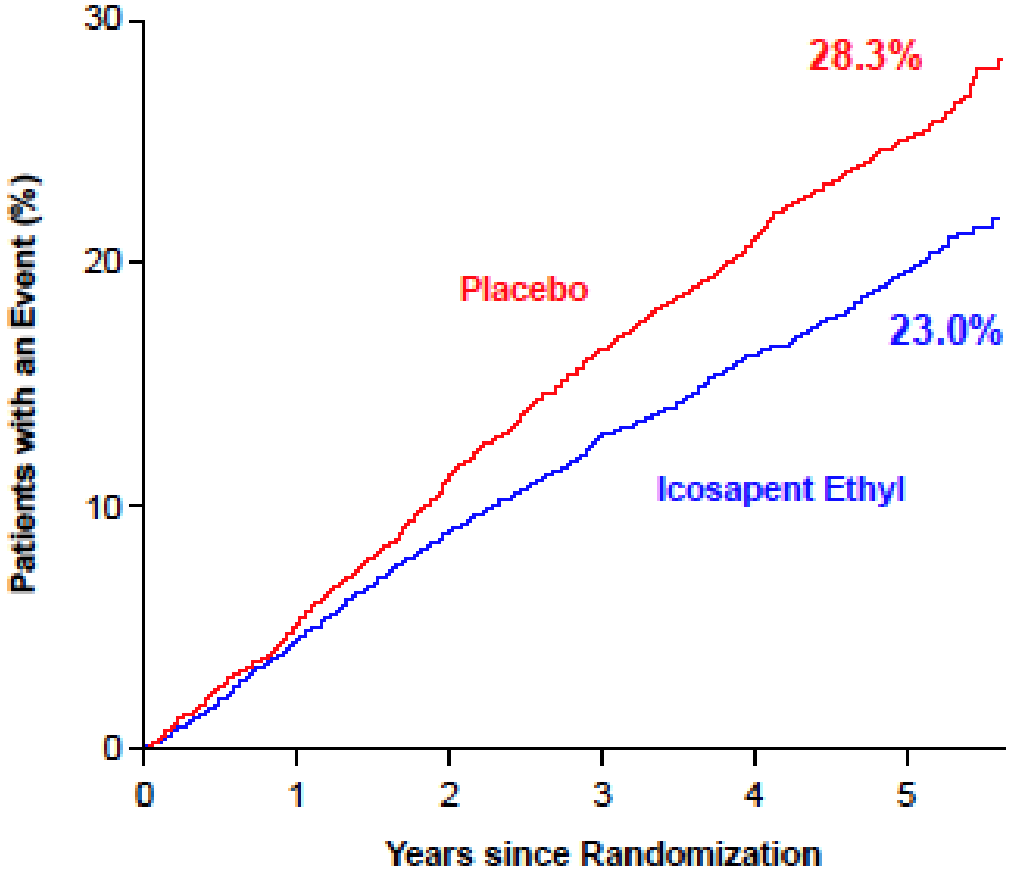
Key Baseline Characteristics

	Icosapent Ethyl (N=4089)	Placebo (N=4090)
Age (years), Median (Q1-Q3)	64.0 (57.0 - 69.0)	64.0 (57.0 - 69.0)
Female, n (%)	1162 (28.4%)	1195 (29.2%)
Non-White, n (%)	398 (9.7%)	401 (9.8%)
Westernized Region, n (%)	2906 (71.1%)	2905 (71.0%)
CV Risk Category, n (%)		
Secondary Prevention Cohort	2892 (70.7%)	2893 (70.7%)
Primary Prevention Cohort	1197 (29.3%)	1197 (29.3%)
Ezetimibe Use, n (%)	262 (6.4%)	262 (6.4%)
Statin Intensity, n (%)		
Low	254 (6.2%)	267 (6.5%)
Moderate	2533 (61.9%)	2575 (63.0%)
High	1290 (31.5%)	1226 (30.0%)
Type 2 Diabetes, n (%)	2367 (57.9%)	2363 (57.8%)
Triglycerides (mg/dL), Median (Q1-Q3)	216.5 (176.5 - 272.0)	216.0 (175.5 - 274.0)
HDL-C (mg/dL), Median (Q1-Q3)	40.0 (34.5 - 46.0)	40.0 (35.0 - 46.0)
LDL-C (mg/dL), Median (Q1-Q3)	74.0 (61.5 - 88.0)	76.0 (63.0 - 89.0)
Triglycerides Category		
<150 mg/dL	412 (10.1%)	429 (10.5%)
150 to <200 mg/dL	1193 (29.2%)	1191 (29.1%)
≥200 mg/dL	2481 (60.7%)	2469 (60.4%)

Bhatt DL, Steg PG, Miller M, et al. *N Engl J Med.* 2018.

Primary End Point:

CV Death, MI, Stroke, Coronary Revasc, Unstable Angina



Hazard Ratio, 0.75
(95% CI, 0.68–0.83)
RRR = 24.8%
ARR = 4.8%
NNT = 21 (95% CI, 15–33)
P=0.00000001

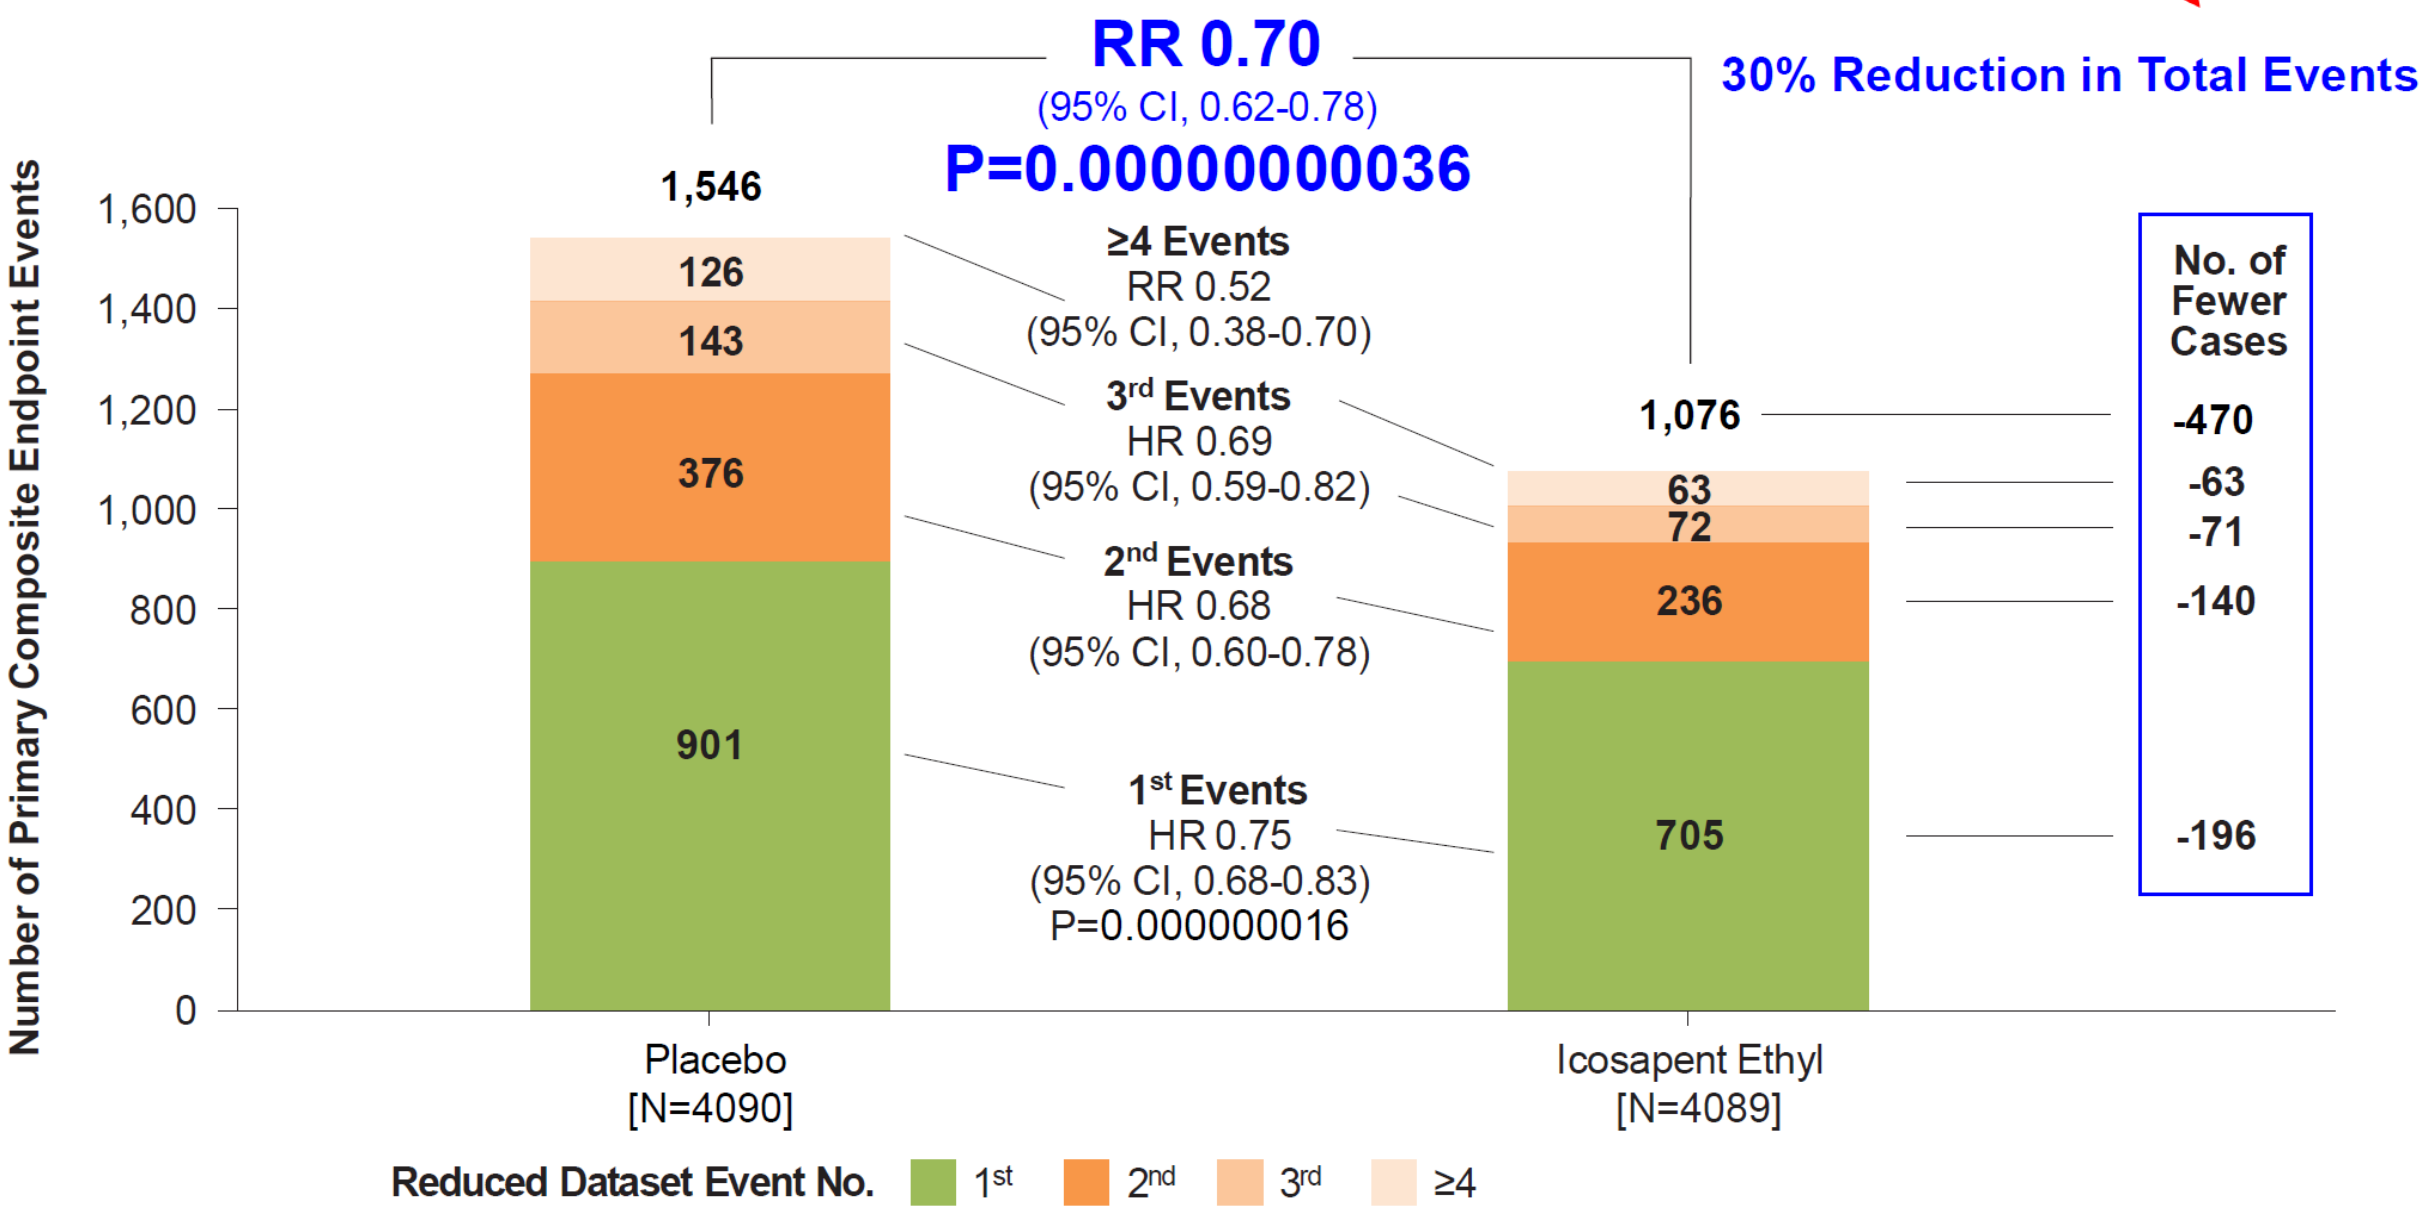
Juliano, PhD, Lixia Jiao, PhD, Craig Granowitz, MD, PhD, Jean-Claude Tardif, MD, John Gregson, PhD, Stuart J. Pocock, PhD, Christie M. Ballantyne, MD, on Behalf of the **REDUCE-IT** Investigators

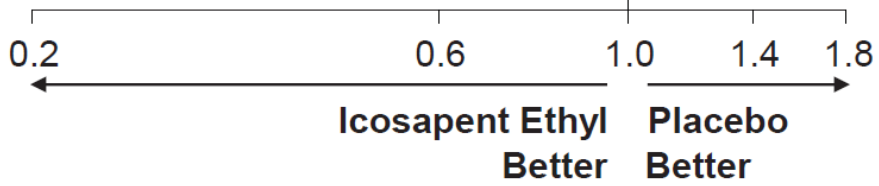
First and Subsequent Events



Note: WLW method for the 1st events, 2nd events, and 3rd events categories; Negative binomial model for ≥4th events and overall treatment comparison.

Primary Composite Endpoint: Total Endpoint Events by Baseline TG Tertiles

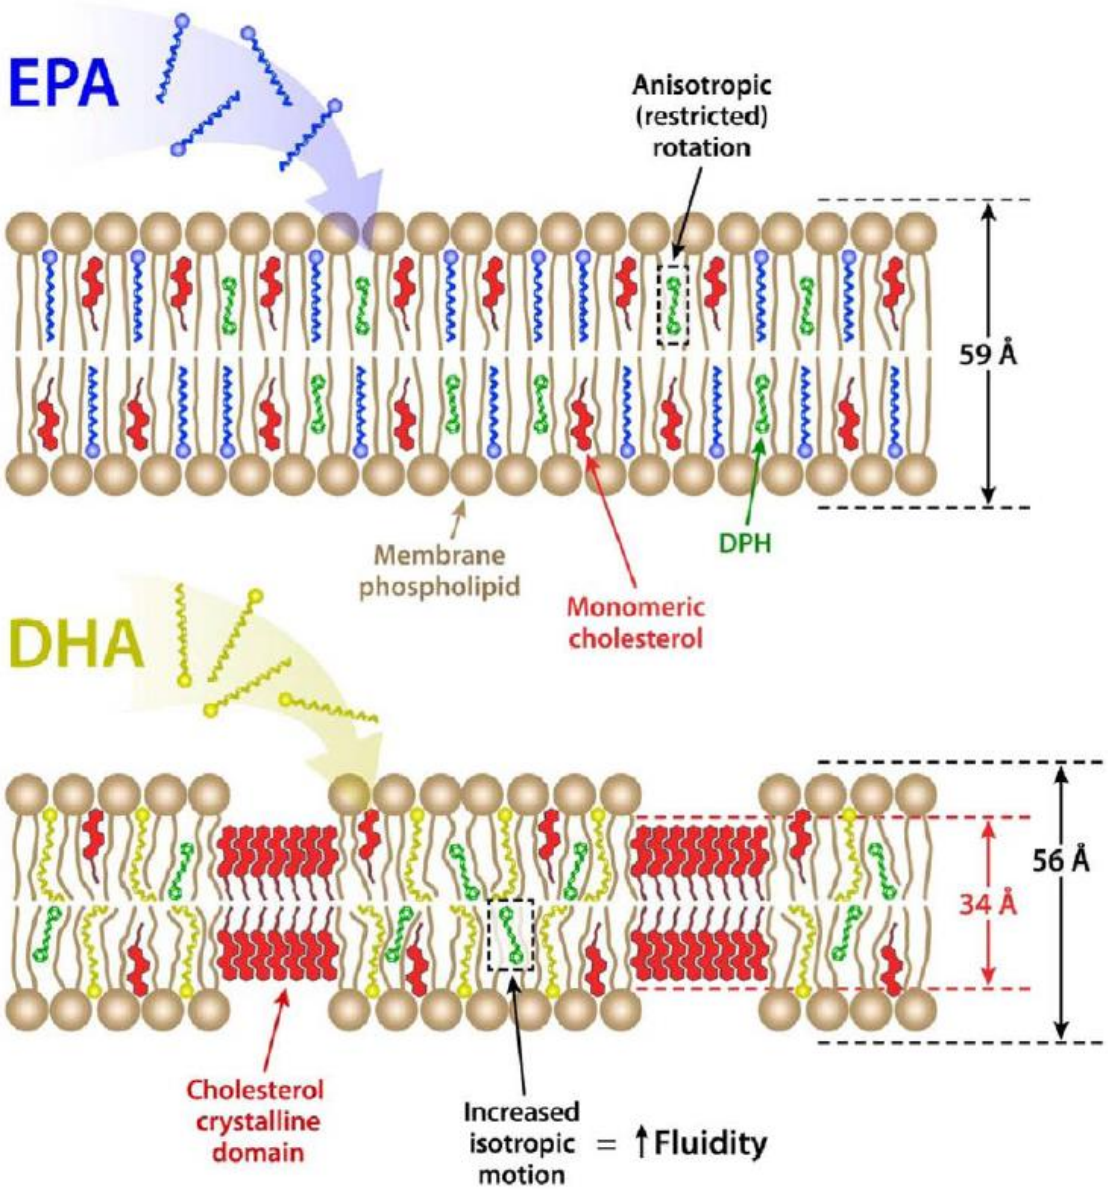
TOTAL EVENTS – Primary Composite Endpoint/Subgroup	Icosapent Ethyl	Placebo	RR (95% CI)	P-value
	Rate per 1000 Patient Years	Rate per 1000 Patient Years		
Primary Composite Endpoint (ITT)	61.1	88.8	0.70 (0.62–0.78)	<0.0001
Baseline Triglycerides by Tertiles*				
≥81 to ≤190 mg/dL	56.4	74.5	0.74 (0.61–0.90)	0.0025
>190 to ≤250 mg/dL	63.2	86.8	0.77 (0.63–0.95)	0.0120
>250 to ≤1401 mg/dL	64.4	107.4	0.60 (0.50–0.73)	<0.0001



***P (interaction) = 0.17**

EPA vs DHA: Membrane Interactions

- Both EPA and DHA integrate into membranes
- EPA lies parallel to surrounding acyl chains
  - Reduces membrane fluidity
  - Reduces formation of cholesterol micro-domains
  - Normalizes bilayer width
- DHA interacts more with the phospholipid head groups
  - Increases membrane fluidity
  - Facilitates formation of cholesterol micro-domains
  - Reduces bilayer width



Sherratt and Mason. Chemistry and Physics of Lipids 2018;212:73-79; Mason et al. Biochimica et Biophysica Acta 2016;1858:3131-3140

Choice of Prescription Om-3

	EE EPA+DHA*	EE EPA only**
Available?	**Yes (generic)**	Yes (branded only)
EPA/DHA (total)	55/45 (84%)	100/0 (98%)
Bioavailability (short-term)	Good	Good
Regimen	2 g bid w/ meals	2 g bid w/ meals
Tolerability issues	Fishy taste & eruct, dyspepsia	**Arthralgia only**
TG-lowering	+++	+++
LDL-C effects	↑↑ (~45%)	**± (no ↑)**
HDL-C effects	↑ (5-10%)	± (no ↑)
↓CVD?	Not at 1g/d, no ongoing trials	**Probably (JELIS) + REDUCE IT**

Severe Hypertriglyceridemia

Chylomicronemia Management
(FCS>>MFSHTG)

Lifelong Dietary Restrictions

Extremely low-fat diet (≤15-20% of energy)

Very-low added-sugar (<100/150 calories, or ~≤7% of energy)

Complete Avoidance of Alcohol

Although difficult, these dietary therapies will ↓TG and can ↓clinical manifestations[1-6]

- ↓Frequency of eruptive xanthomas
- ↓Risk of acute & chronic pancreatitis[1-5]
- ↓Other abdominal pain
- ↓Hepatosplenomegaly
- ↓Peripheral neuropathy, CNS abnormalities

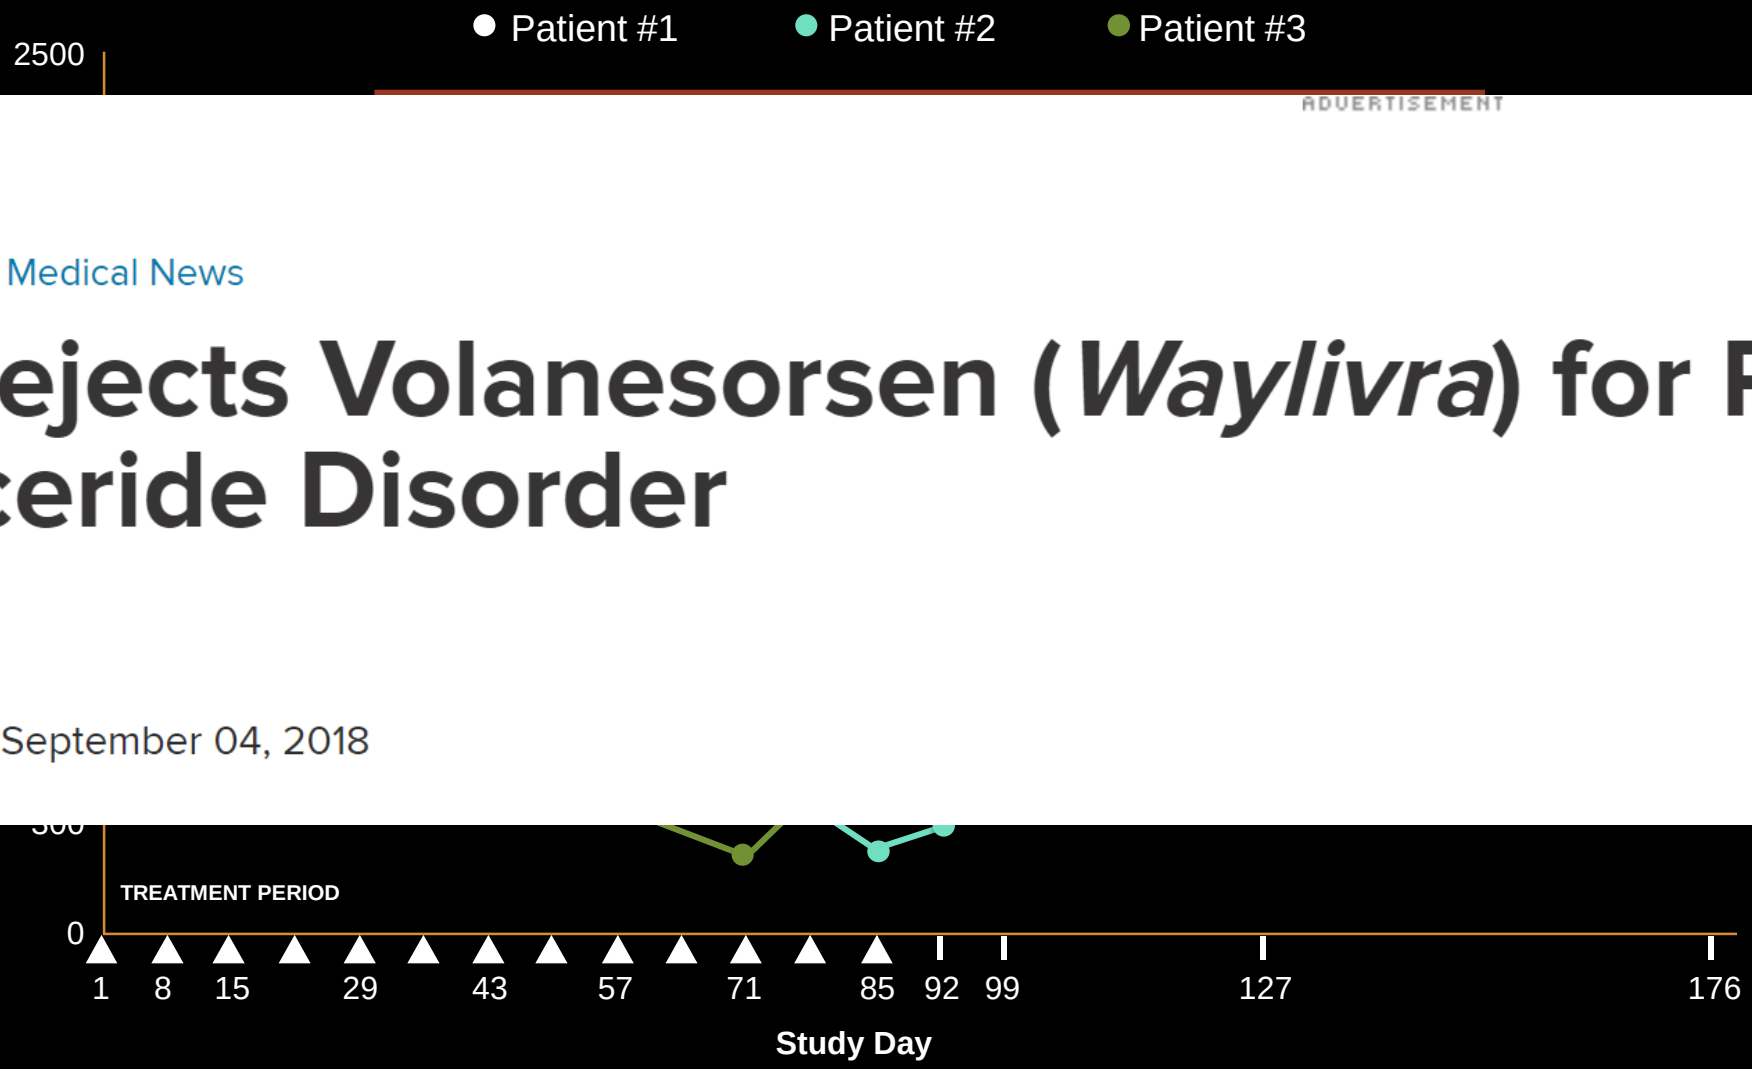
Apo C-III Anti-sense RNA (Volanesorsen) Ph-2 in FCS: 300 mg Reduced Fasting Plasma TG Levels



Gaudet D, et al. *N Engl J Med*. 2014;371(23):2200-2206

Take on message

1. Always address for secondary causes

2. Lifestyle modifications for everyone

3. Choose medication according to the patient risk factors.

Summary

TG >1000

- Primary goal: Reduce pancreatitis first
- Medications : Fibrates > Omega 3> Niacin

TG 500-999 ng/dL

- Primary goal: Reduce pancreatitis first
- Statin is “OK” if no history of pancreatitis
- Medications: Fibrates >Omega 3 > Niacin

Summary

TG > 200-499

- Primary goal: Reduce ASCVD risk by reducing atherogenic lipoprotein burden
- Statins are preferred as initial therapy
- If non-HDL goals are not met, consider adding Omega-3 FA or fibrate to statin therapy.
