

# Cardiorenal Effects of SGLT2-Inhibitors: A Class Effect?

Marielly Sierra Mercado, MD

# Overview

- ◆ Overview of cardiovascular and renal effects of diabetes mellitus.
- ◆ Physiology of SGLT-1 and SGLT-2.
- ◆ Compare available SGLT-2 inhibitors and their differences on receptor affinity.
- ◆ Summarize and compare the four SGLT-2 inhibitors clinical trials.
- ◆ Explore the potential determinants for their cardiovascular, renal and safety outcomes.
- ◆ Class effect?

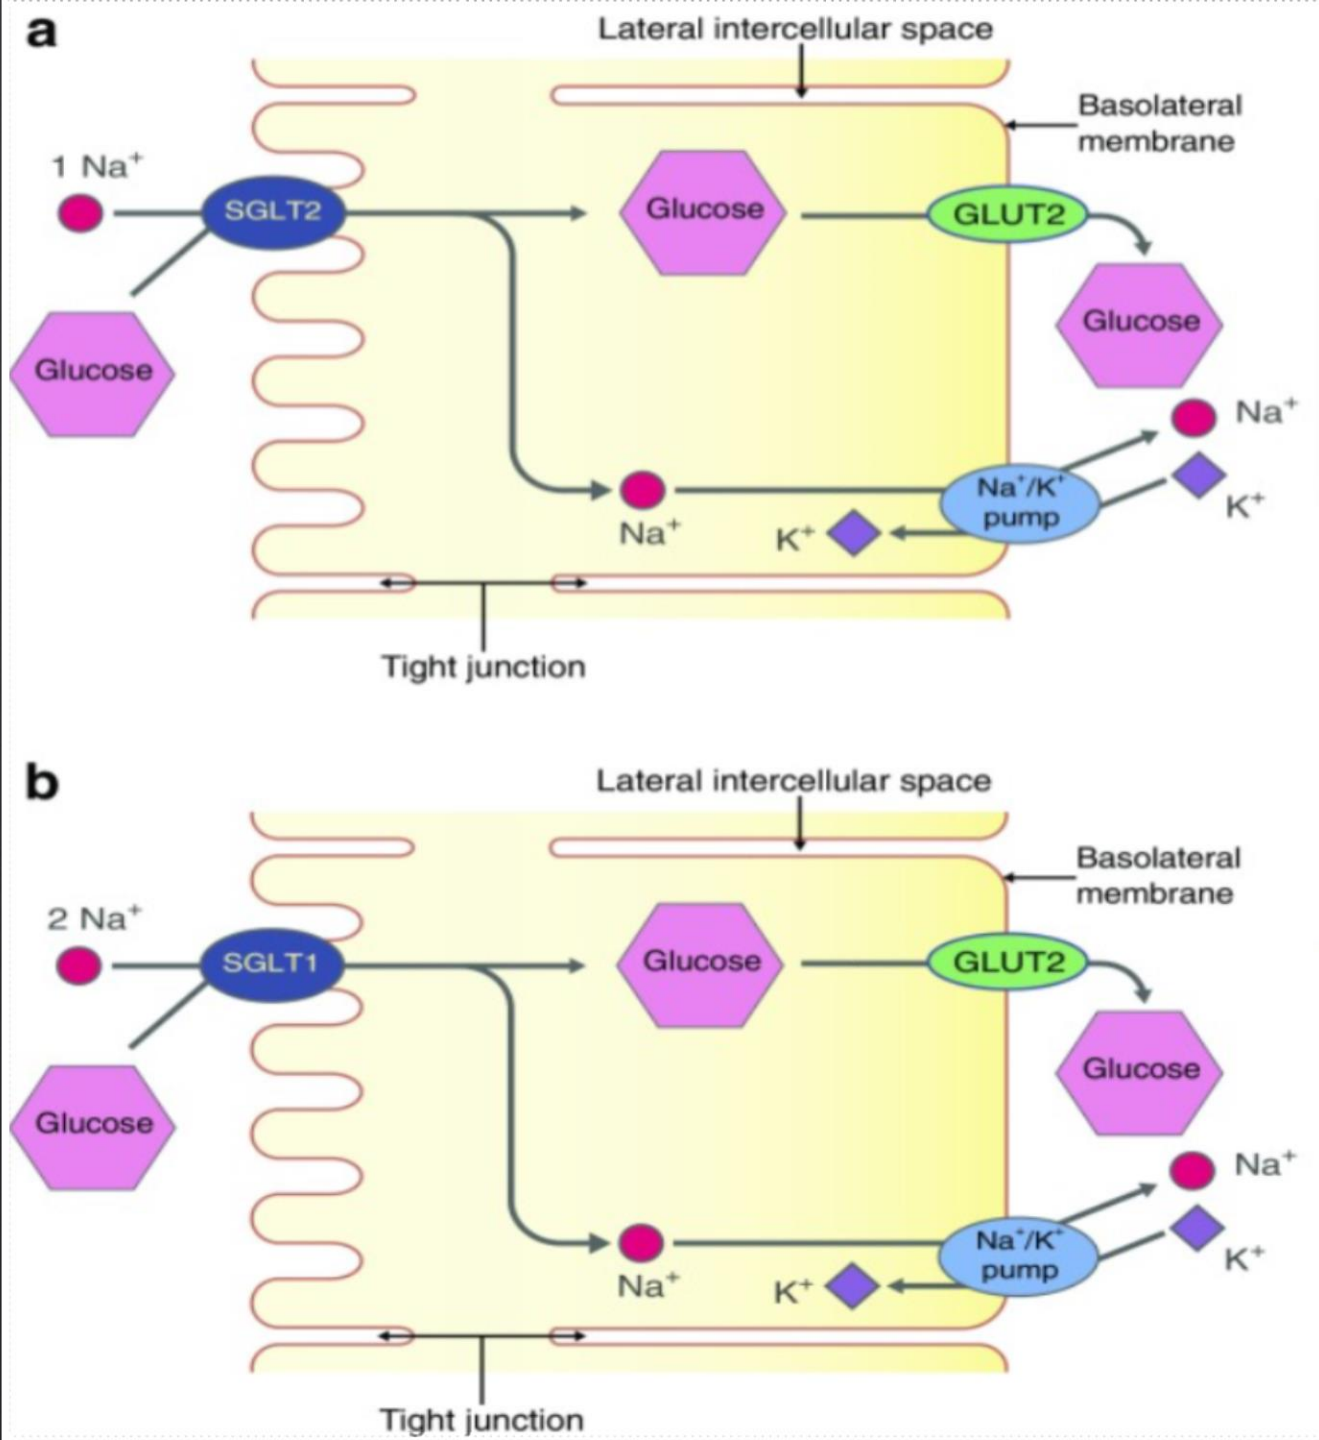

# Cardiorenal effects of Diabetes Mellitus

- ◆ At least 68 percent of people age 65 or older with diabetes die from some form of heart disease; and 16% die of stroke.
- ◆ Adults with diabetes are two to four times more likely to die from heart disease than adults without diabetes.
- ◆ The American Heart Association considers diabetes to be one of the seven major controllable risk factors for cardiovascular disease.
- ◆ Patients with diabetes mellitus have  $>2\times$  the risk for developing heart failure. Approximately 44% of hospitalized patients for HF have DM.
- ◆ It is also well known that diabetes is linked to kidney failure; about 30% of those with type 1 diabetes and 10% to 40% with type 2 diabetes (T2D) will progress to this stage.

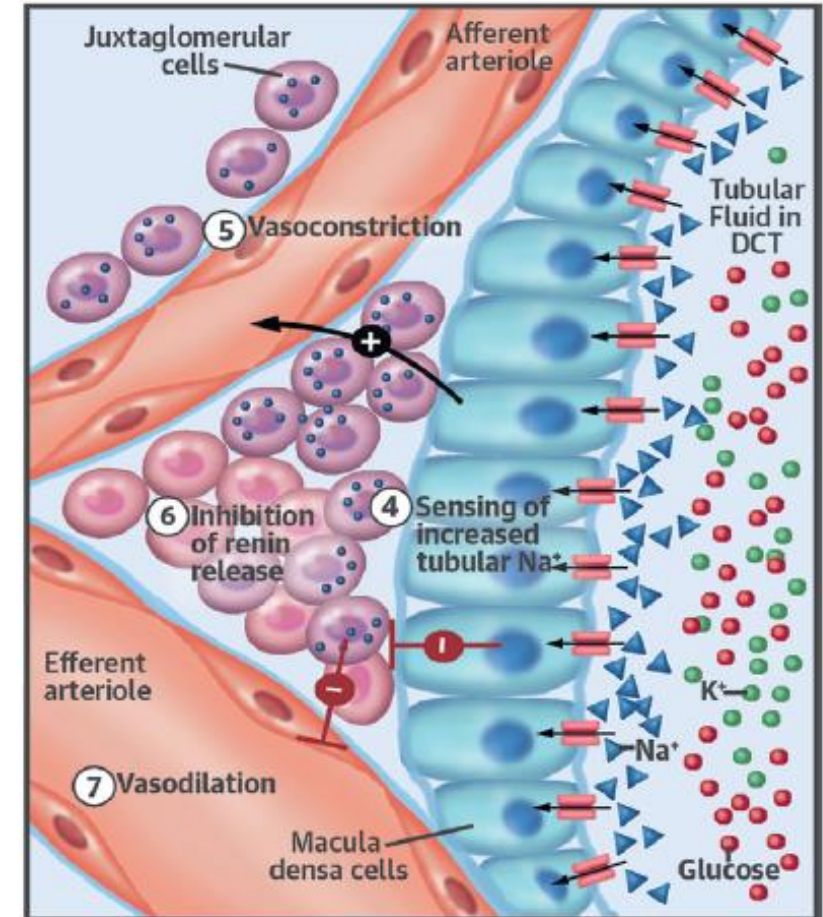

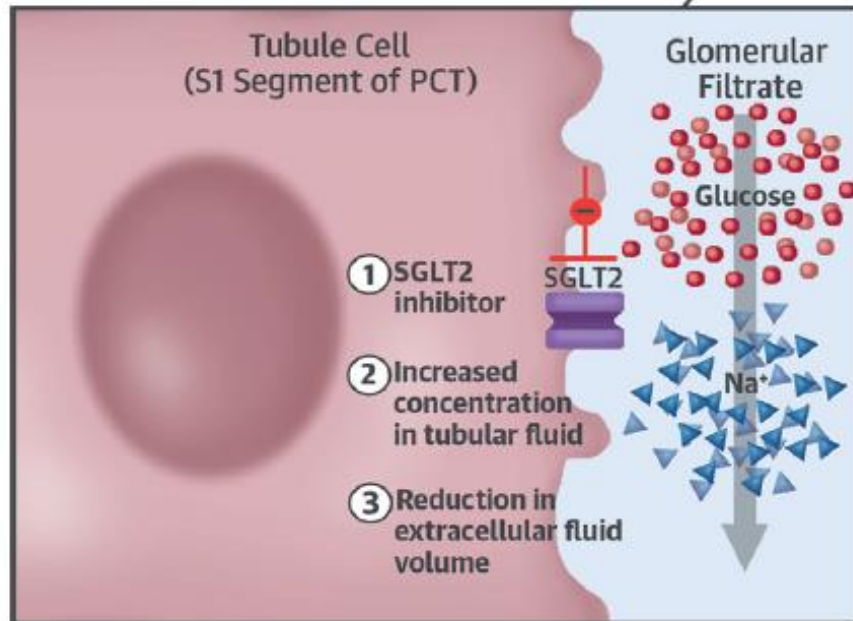

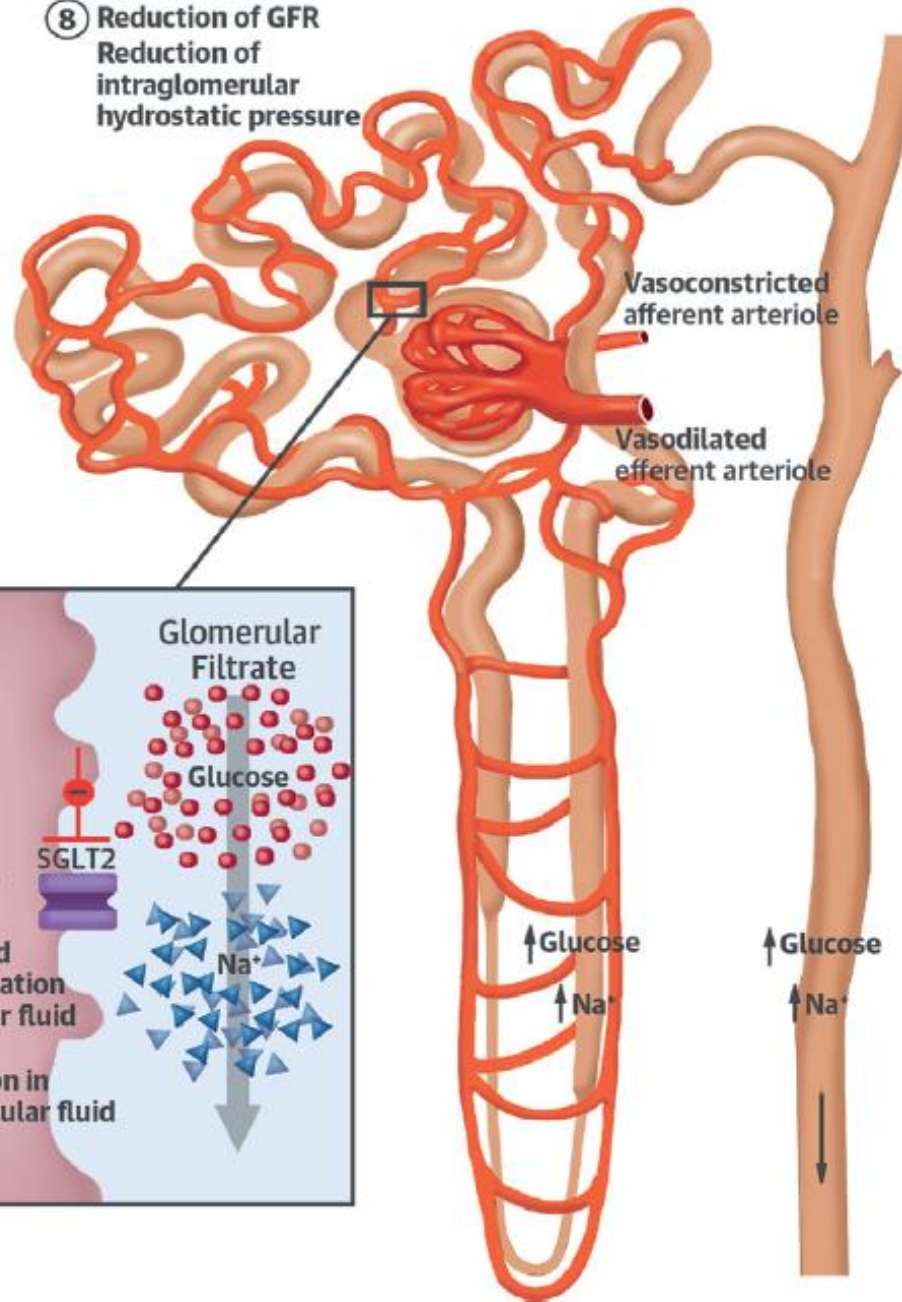

# Sodium Glucose Transporters

<b>Characteristic</b>	<b>SGLT1</b>	<b>SGLT2</b>
<b>Location</b>	<b>Small Intestine, Later portion of PTC (segment 3)</b>	<b>Early PTC (segment 1 and 2)</b>
<b>Capacity</b>	<b>Low</b>	<b>High</b>
<b>Affinity</b>	<b>High</b>	<b>Low</b>
<b>Contribution to glucose reabsorption</b>	<b>10%</b>	<b>90%</b>
<b>Disease if mutation occurs</b>	<b>Glucose-Galactose Malabsorption</b>	<b>Familial Renal Glucosuria</b>
<b>Manifestations of disease</b>	<b>Diarrhea at few days of age</b>	<b>None</b>
<b>Course</b>	<b>Fatal if not controlled by low CHO diet</b>	<b>Benign</b>
<b>Inhibitors</b>	<b>Phlorizin</b>	<b>Current Available SGLT2 i</b>

## Four FDA Approved SGLT2 Inhibitors

### ◆ Empagliflozin

(EMPA REG Trial)

### ◆ Canagliflozin

(CANVAS and CREDENCE)

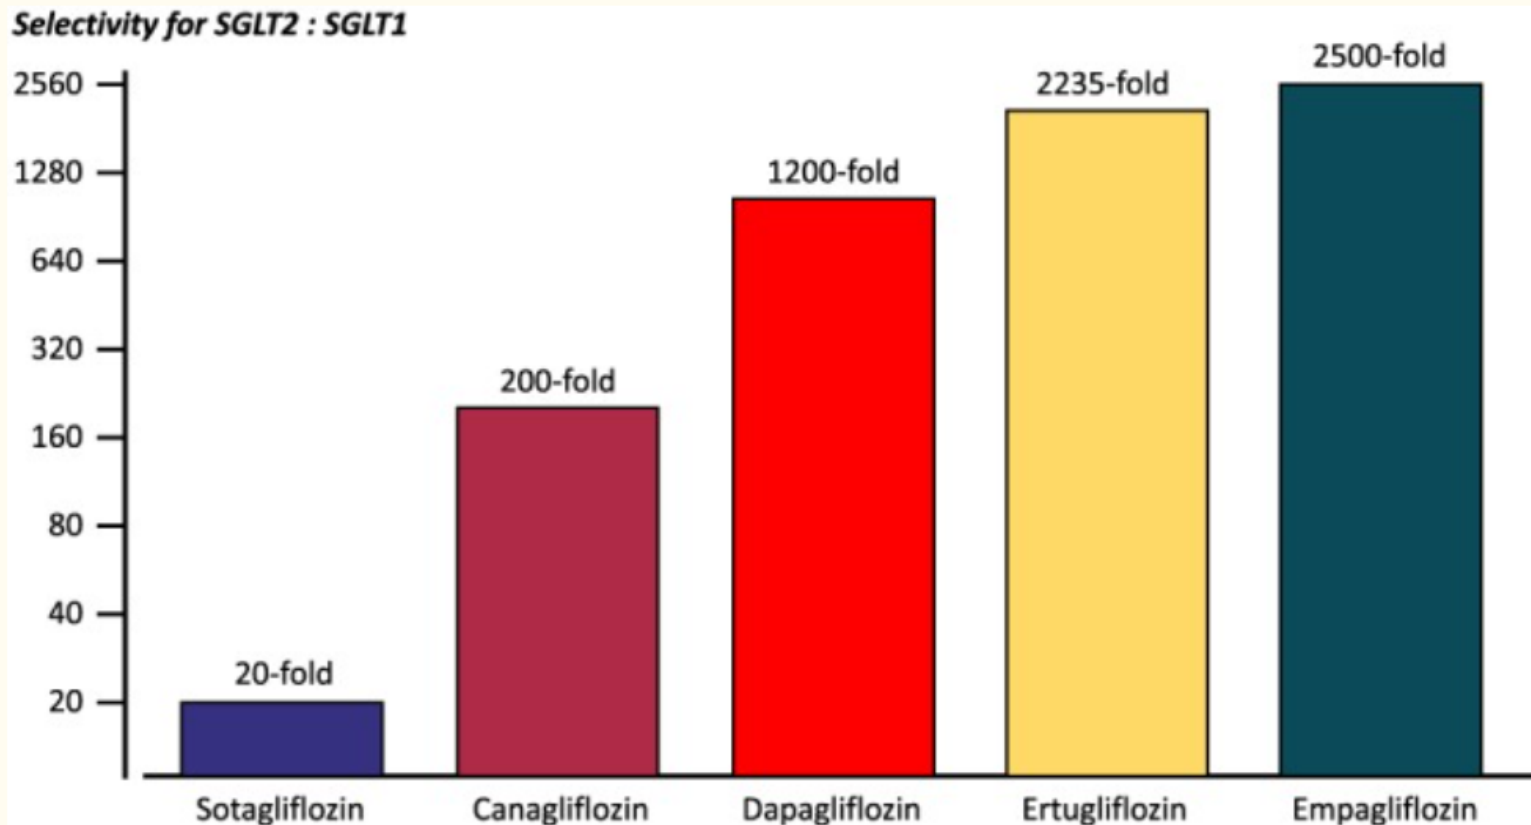

### ◆ Dapagliflozin

(DECLARE-TIMI 58)

### ◆ Ertugliflozin

(VERTIS, VERTIS CV)

# Selectivity for SGLT2 versus SGLT1

[Figure 1](#)

Selectivity of different compounds of the class for the sodium-glucose co-transporter-2 (SGLT2) vs. SGLT1.

# A1C effect of Available SGLT2 Inhibitors

Drug	Hgb A1C Reduction %
Canagliflozin	-0.73 to -1.08
Dapagliflozin	-0.52 to -0.59
Empagliflozin	-0.62 to -0.66
Ertugliflozin	-0.7 to -1.7

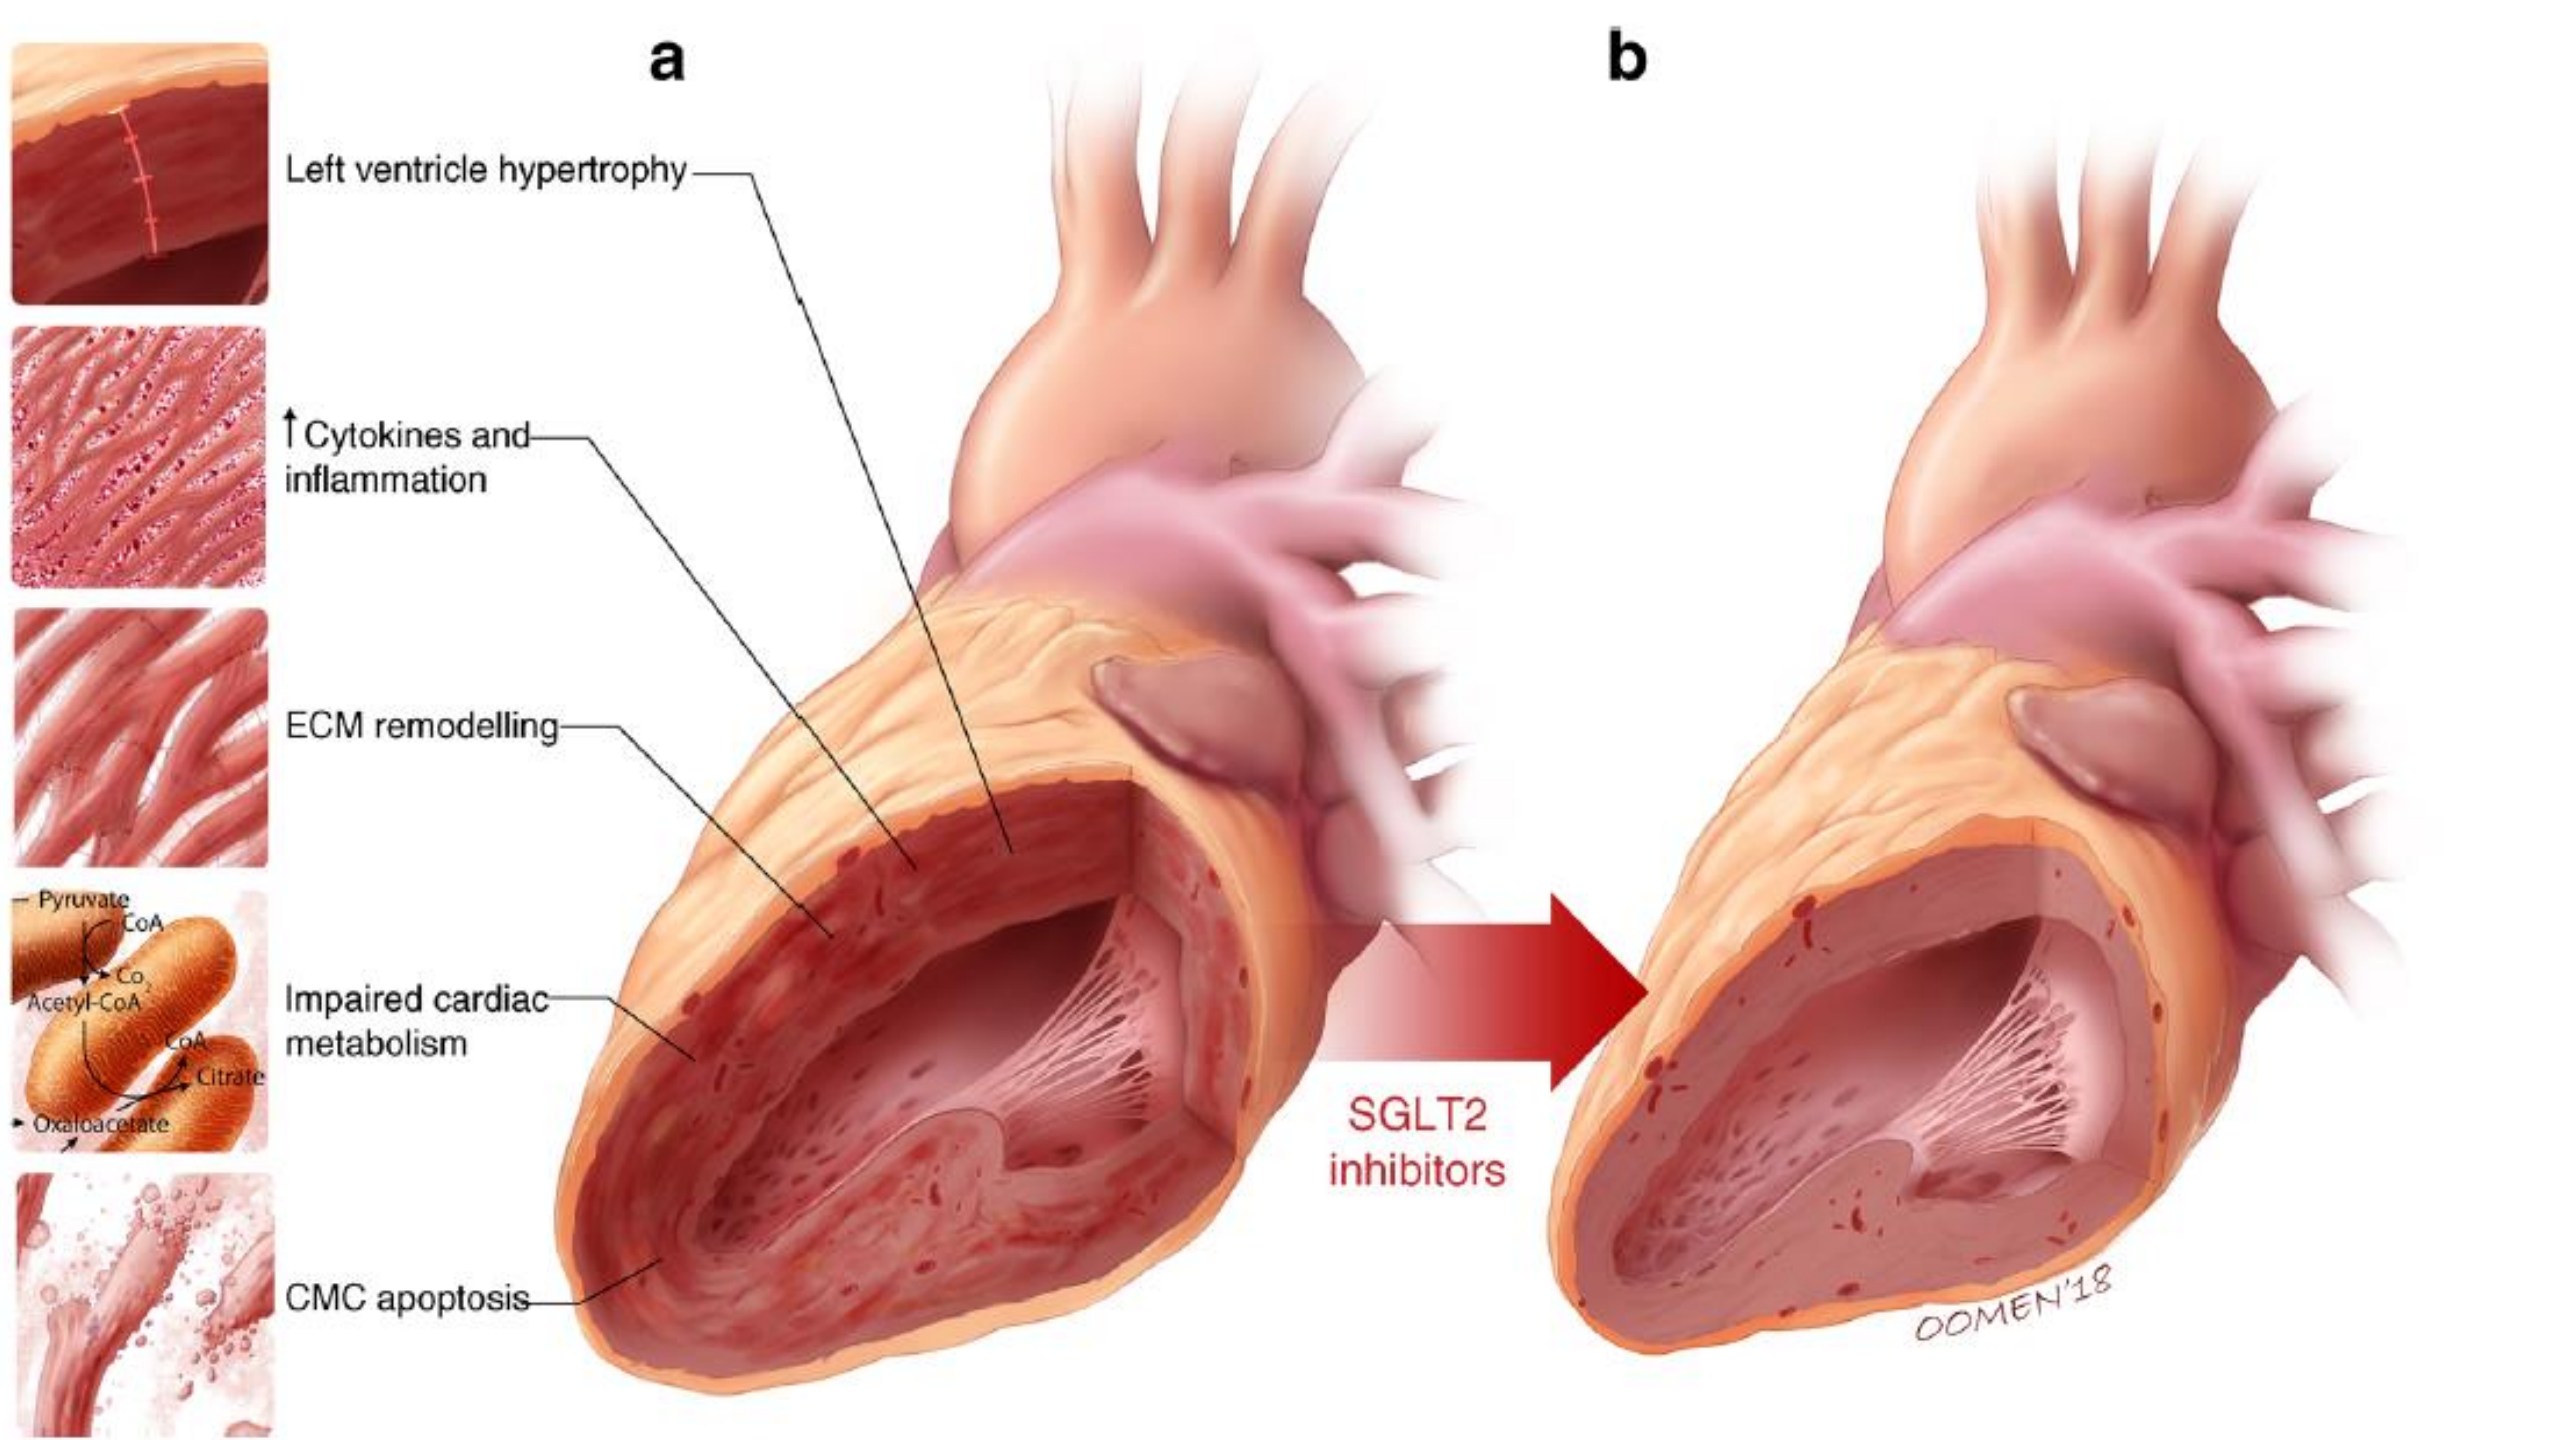

# **Pleiotropic Effects of SGLT2 Inhibitors: Beyond Glycemic Effect**

## Body Weight

- ❖ Believed to result from an increase in urinary glucose excretion.
- ❖ Associated with daily glucose losses of 60–80 g or 240–320 calories.
- ❖ Body weight reductions observed after 12–24 weeks of therapy are typically in the 2- to 3-kg range.
- ❖ Although fluid loss may initially play a role in weight loss, overall reductions in body weight are believed to be mainly the result of fat loss.

## Blood Pressure

- ❖ Diuretic effects of SGLT-2is through increased urinary excretion of glucose and sodium.
- ❖ This also leads to sustained reductions in intravascular volume, which likely contribute to the antihypertensive effects of SGLT-2i.

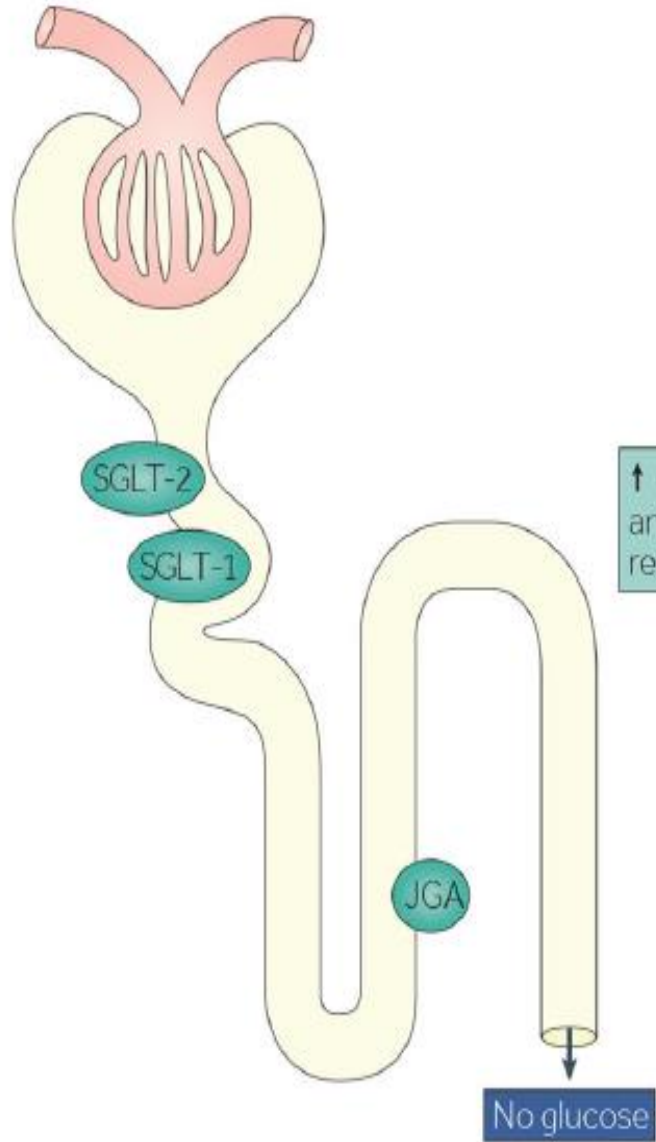

# Renal Effect

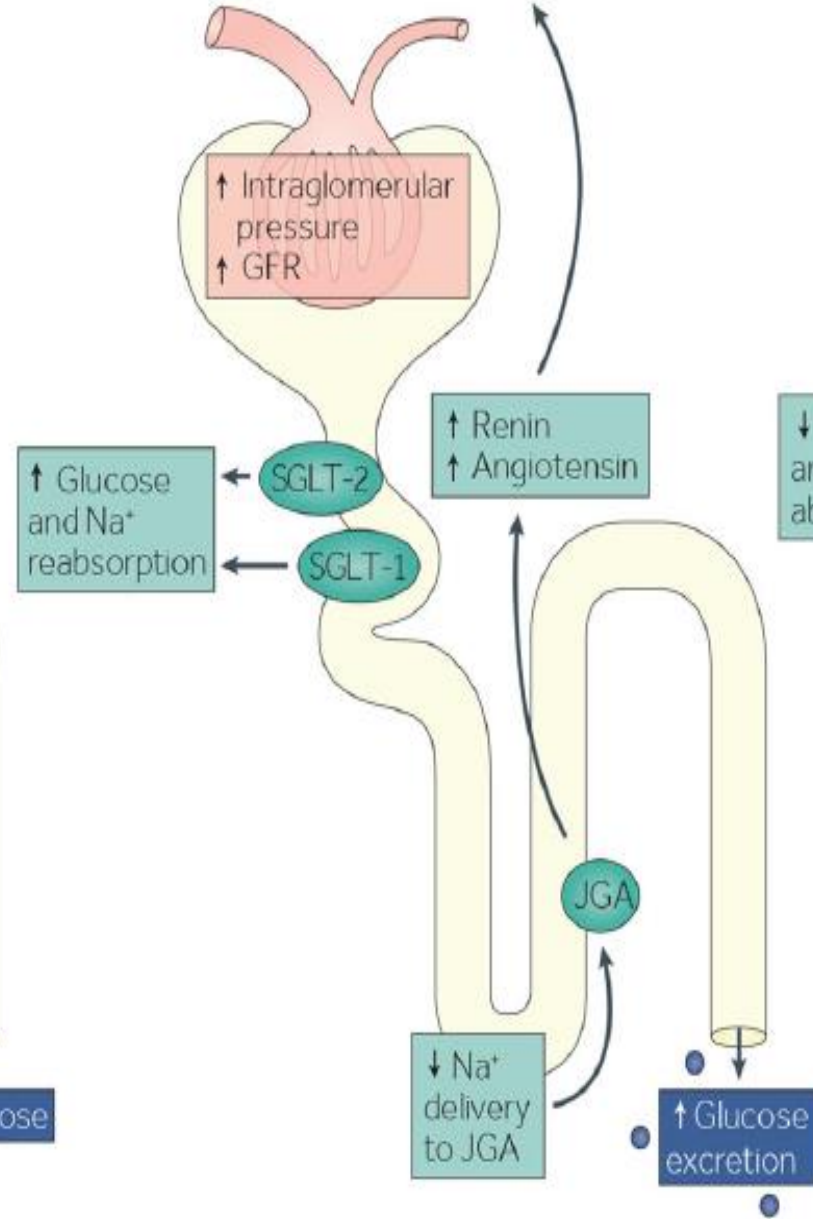

### a Normal TGF

Afferent arteriole      Efferent arteriole

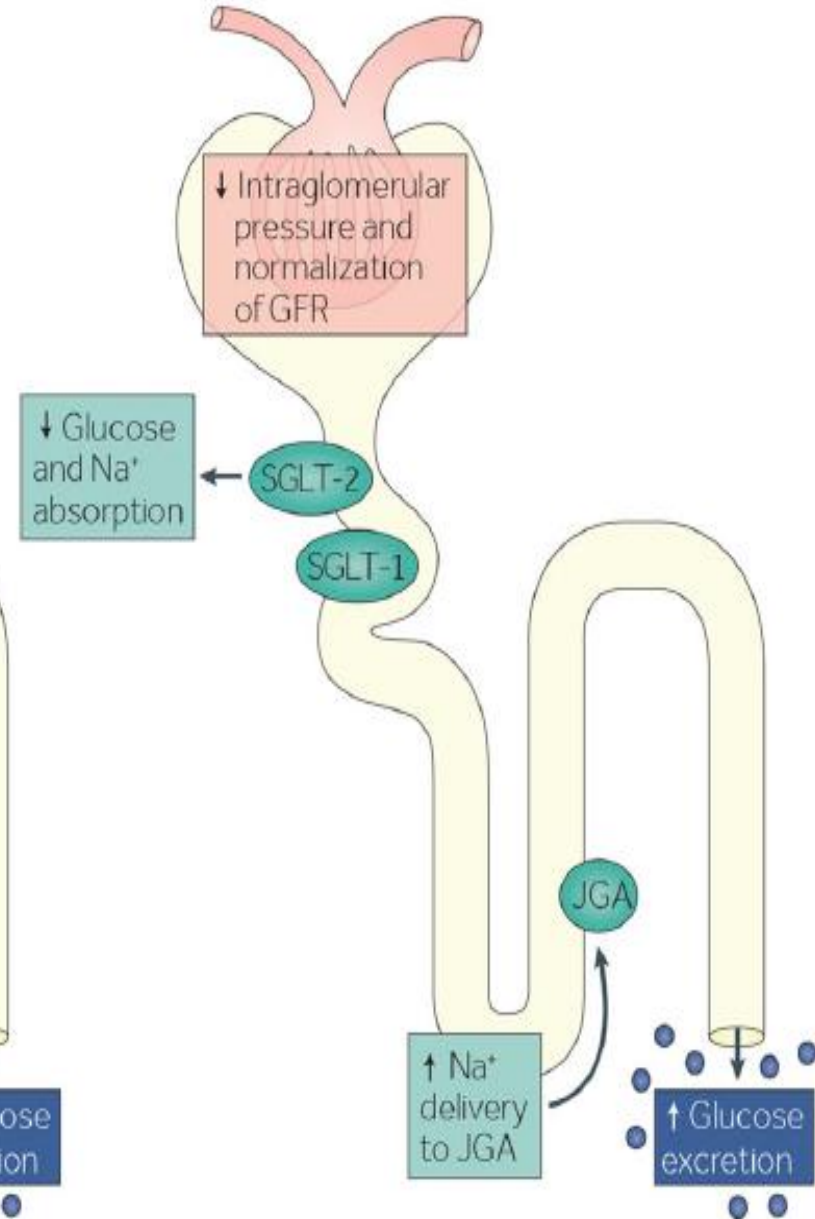

### b Diabetes

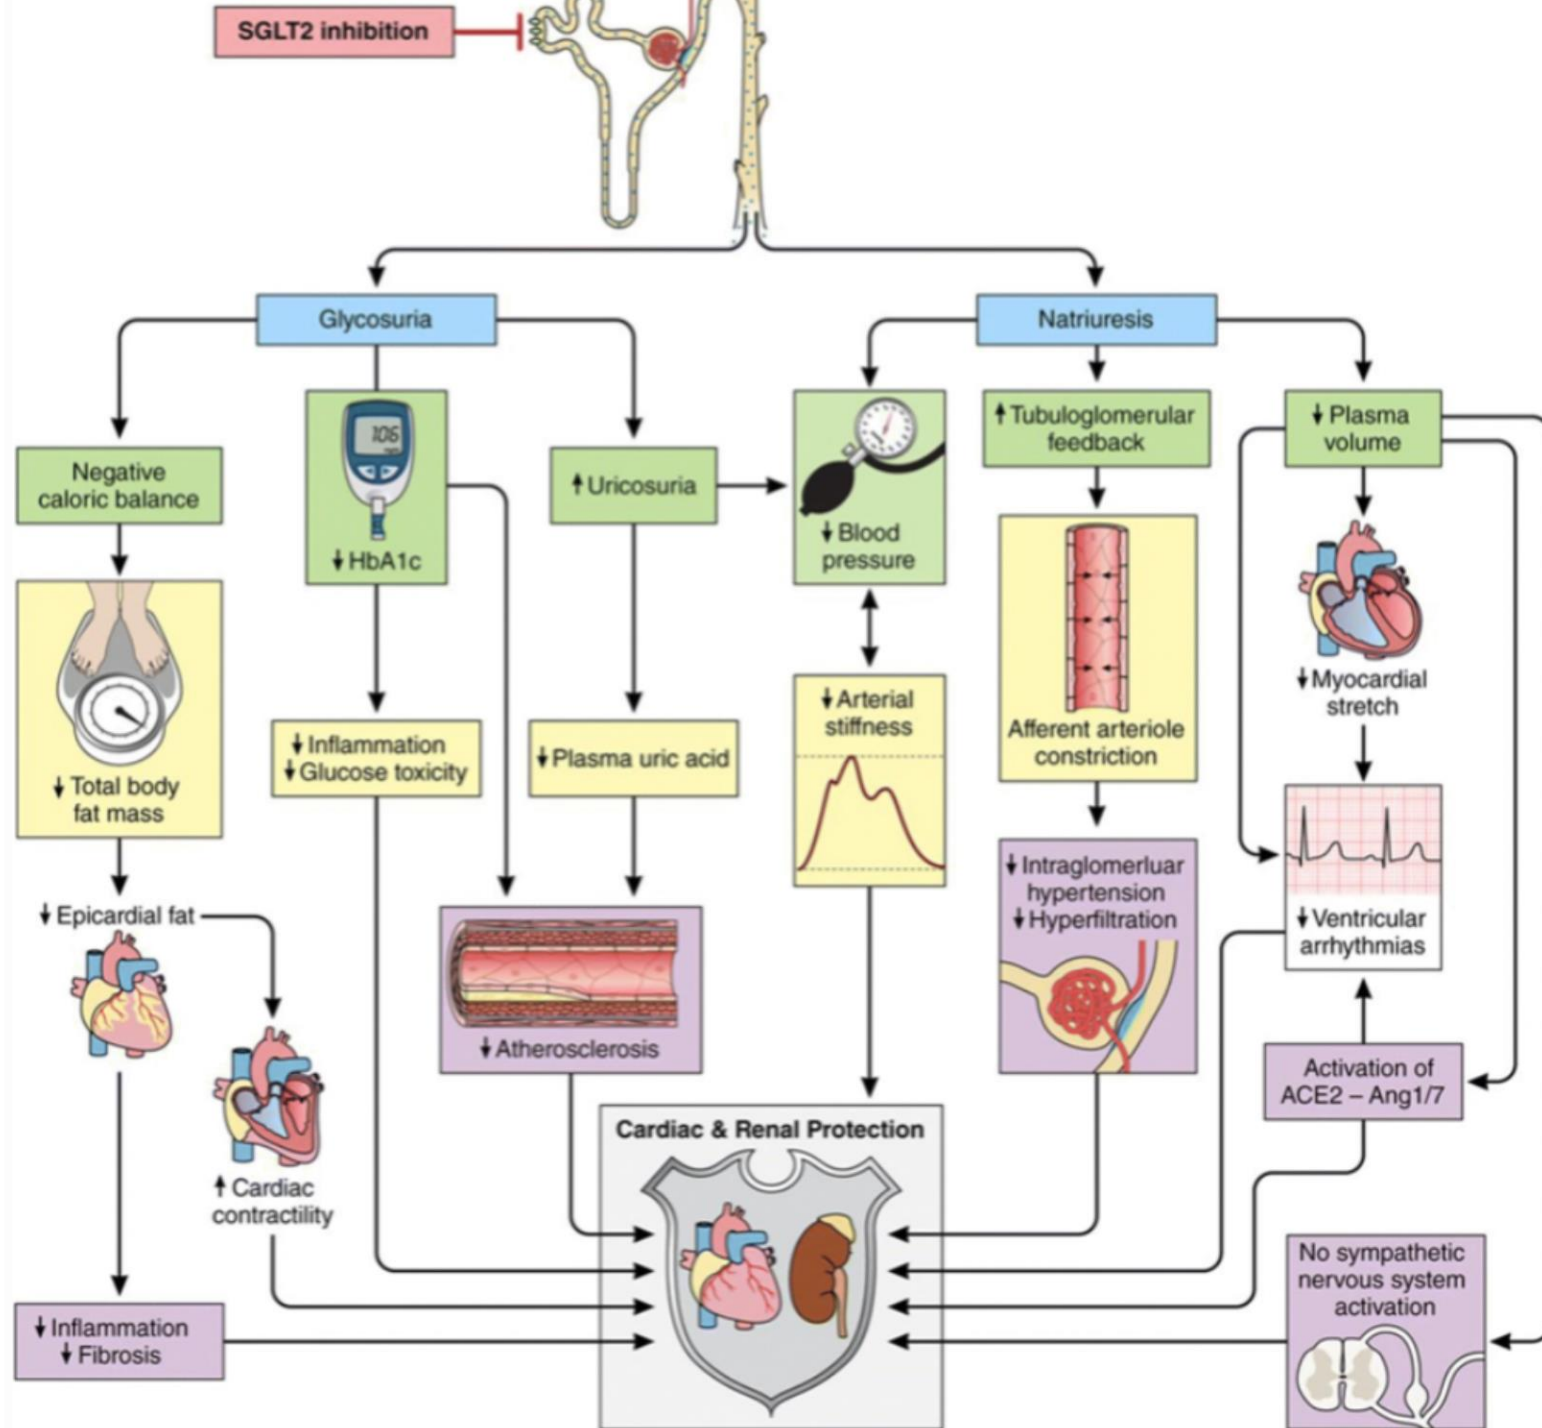

Afferent arteriole vasodilation      Efferent arteriole vasoconstriction

### c Diabetes and SGLT-2 inhibition

Afferent arteriole vasoconstriction      Efferent arteriole unaffected

# SGLT2 Inhibitors Clinical Trials

<u>EMPA REG Trial</u>	<u>CANVAS</u>
<ul style="list-style-type: none"> <li>First CVOTs, with 7020 patients with T2DM <u>and</u> established CVD. 10 or 25 mg Empagliflozin or placebo. Mean age: 63.1, female: 28%</li> </ul>	<ul style="list-style-type: none"> <li>Second CVOTs with 10,142 patients with T2DM daily Cana 100 mg with optional increase to 300 mg or placebo. Mean age: 63 years, 36% female.</li> </ul>
<ul style="list-style-type: none"> <li>3.1 years follow up period. History of myocardial infarction: 47%, multivessel disease: 47%, coronary artery bypass grafting: 25%</li> </ul>	<ul style="list-style-type: none"> <li>2.4 years period. Patients must be &gt; 30 years with established CVD or &gt; 50 years with at least 2 risk factors. (65.6% had CVD).</li> </ul>
<ul style="list-style-type: none"> <li>eGFR &gt; 30 ml/min (MDRD), mean eGFR was 74 +/- 21: <b>(74% pts had eGFR &gt; 60 ml/min).</b></li> </ul>	<ul style="list-style-type: none"> <li>eGFR &gt; 30 ml/min (MDRD).</li> <li>Mean eGFR: 76.5 +/- 20.</li> <li>20% had eGFR &lt; 60, 79.9% had eGFR &gt; 60 ml/min</li> </ul>
<ul style="list-style-type: none"> <li>4171 patient had microalbuminuria, 769 had macroalbuminuria.</li> </ul>	<ul style="list-style-type: none"> <li>69.8% had microalbuminuria</li> <li>22.6% had UACR 30-300 and 7.6% had macroalbuminuria</li> </ul>
<ul style="list-style-type: none"> <li>5666 patients used ACEi/ARBs (80%)</li> </ul>	<ul style="list-style-type: none"> <li>8116 patients used ACEi/ARBs</li> </ul>

## DECLARE-TIMI 58

- Third CVOTs, with 17,160 patients with T2DM at 10 mg Dapagliflozin or placebo.
- Established CVD or > 1 risk factors including men  $\geq 55$  years or women  $\geq 60$  years.

- Duration follow up: 4.2 years.
- Female 37%
- 40% had established CVD

- Mean eGFR: 85.2 ml/min (CKD-EPI)
- 92% of patients had eGFR > 60 ml/min

- 67.9% had UACR < 30mg/g
- 23 % had UACR 30-300 mg/g
- 6.8% had UACR >300 mg/g

- 81.3% used ACEi/ARBs

## CREDENCE

- 4401 patients with T2DM and CKD.
- 100 Canagliflozin or placebo
- 50.4% had established CVD, but it was not required for inclusion criteria.
- 16% had baseline hx of HF
- Required to have albuminuria

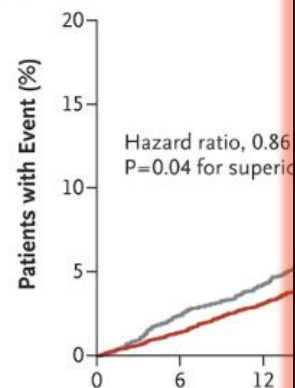

- Duration of follow-up: 2.62 years
- Mean patient age: 63.0 years
- Percentage female: 33.9%

- Mean eGFR: 56.2  $\pm$  18 (CKD-EPI)
- 59% eGFR <60 ml/min
- Mean UACR: 927 mg/g (only 31 patients had UACR <30)

- 11.3% had UACR > 30-300 mg/g
- 76.6% had UCAR 300-3000 mg/g
- 11.4% had UCAR > 3000 mg/g

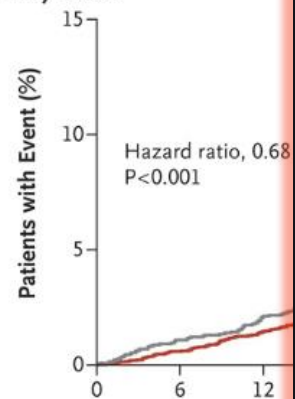

- 99.9% used ACEi/ARBs (it was required)

# Comparing Clinical Trials

**Fig. 1** Baseline estimated glomerular filtration rates (eGFRs) and prior cardiovascular disease (CVD) rates in the Dapagliflozin Effect on CardiovascuLAR Events (DECLARE-TIMI 58), CANagliflozin CardioVascular Assessment Study (CANVAS) Program, Empagliflozin Cardiovascular Outcome Event Trial in Type 2 Diabetes Mellitus Patients–Removing Excess Glucose (EMPA–REG OUTCOME), and Canagliflozin and Renal Events in Diabetes with Established Nephropathy Clinical Evaluation (CREDENCE) trials. Prior CVD displayed as incidence (percentage)

#### DECLARE-TIMI 58

Baseline renal status: eGFR=85.2; UACR = 13.1 [6.0, 43.6]; n=17,160.

Composite renal outcome: ≥40% reduction in eGFR to <60, ESRD (dialysis ≥90 days, transplant or sustained eGFR<15), or renal/CV death

#### CANVAS

Baseline renal status: eGFR=76.5±20.5; UACR = 12.3 [6.65, 42.1]; n=10,142.

Composite renal outcome: ≥40% reduction in eGFR, RRT (transplant, chronic dialysis, or sustained eGFR<15), or renal death

#### EMPA-REG OUTCOME

Baseline renal status: eGFR=74±21; 59.4% UACR<30, 28.6% UACR >30-300, 11.0% UACR >300; n=7020.

Composite renal outcome: Doubling of serum Cr with eGFR ≤45, RRT, or renal death

#### CREDENCE

Baseline renal status: eGFR=56.2±18.2; UACR = 927 [463, 1833]; n=4401.

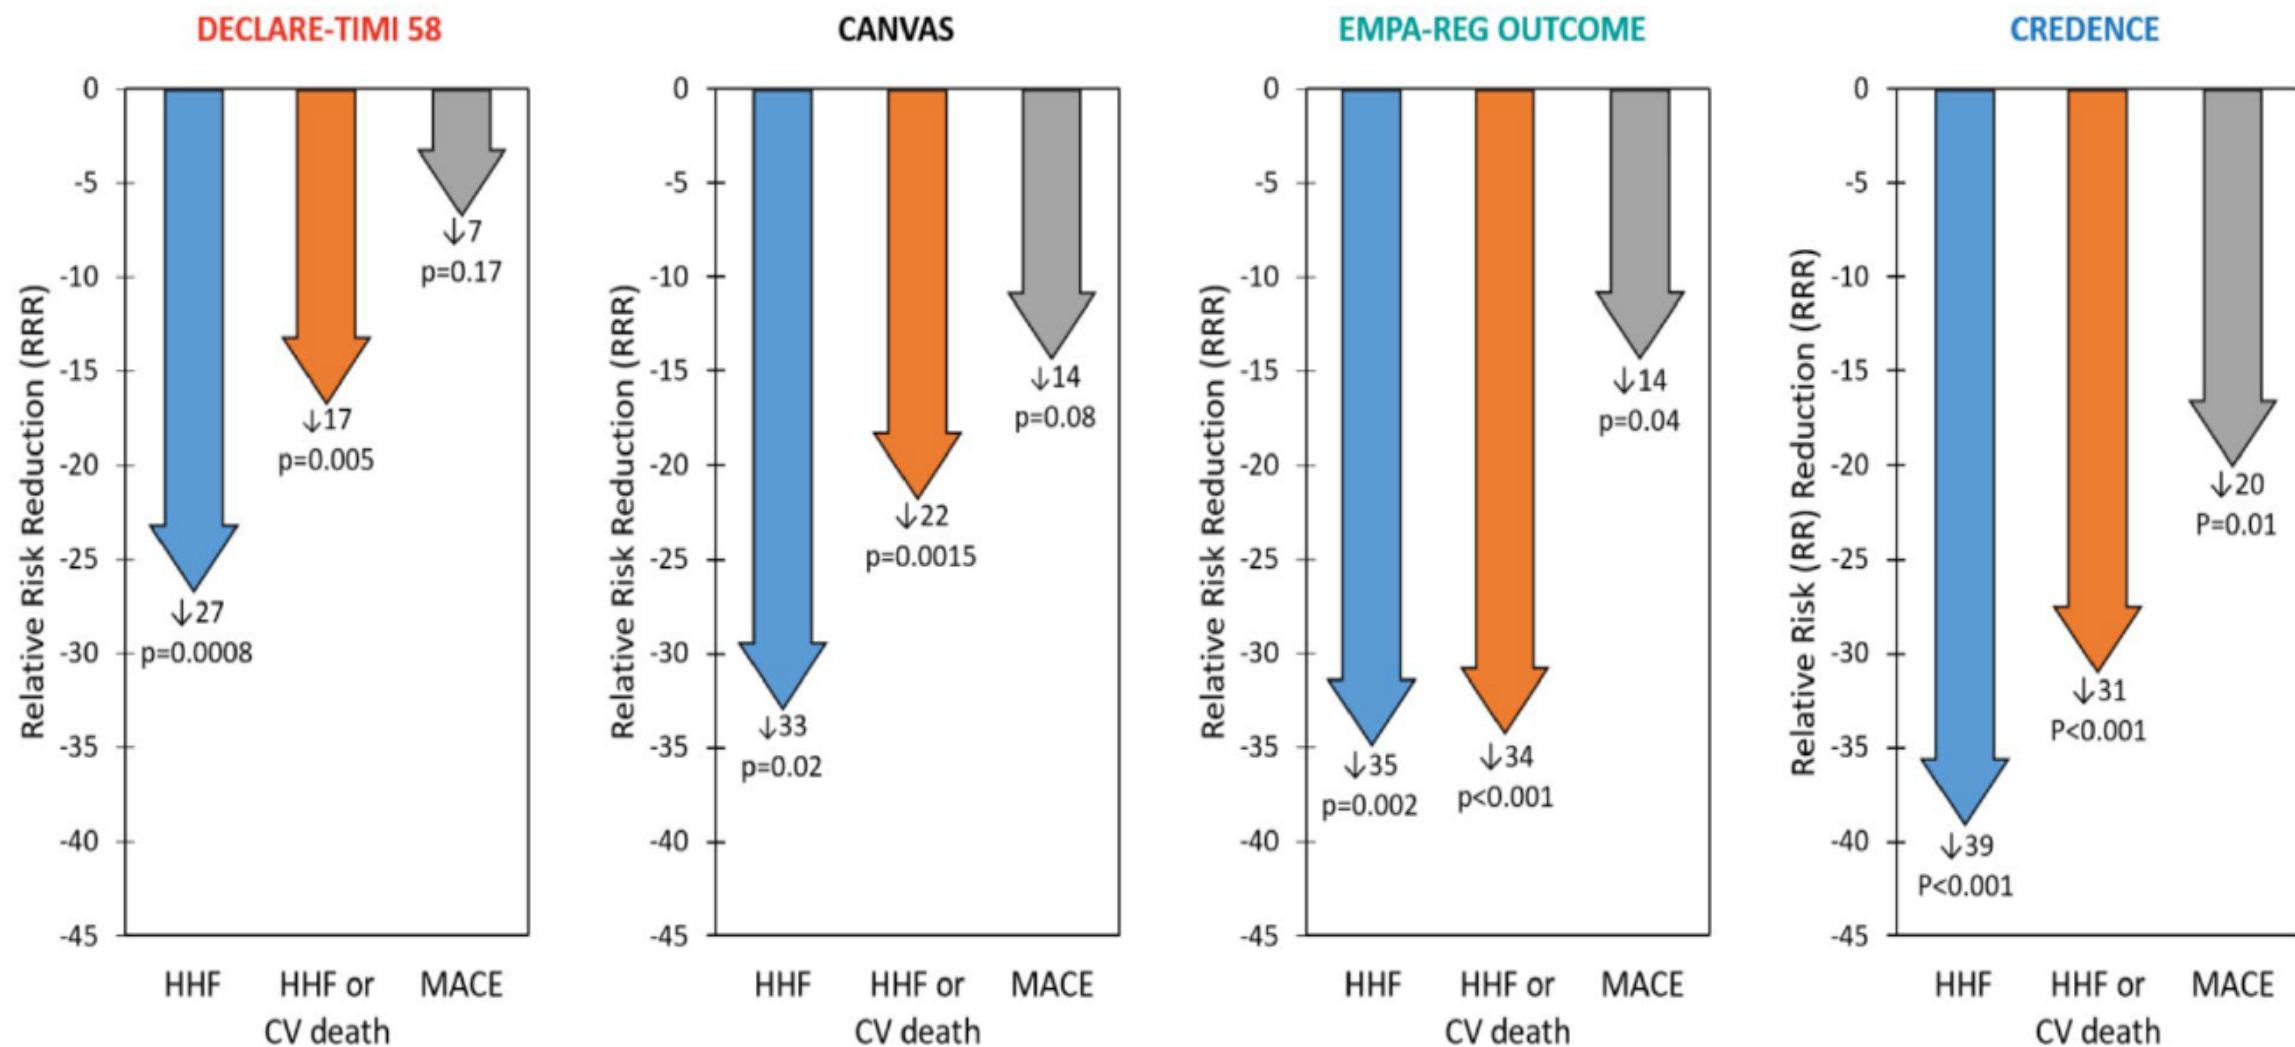

Composite renal outcome: Doubling of serum Cr, ESRD (eGFR <15, dialysis, or renal transplant), renal/CV death

**Table 1 Renal drug guidelines, entry criteria, mean estimated glomerular filtration rate, and composite outcome definitions in the Dapagliflozin Effect on Cardiovascular Events (DECLARE-TIMI 58), CANagliflozin CardioVascular Assessment Study (CANVAS) Program, Empagliflozin Cardiovascular Outcome Event Trial in Type 2 Diabetes Mellitus Patients–Removing Excess Glucose (EMPA–REG OUTCOME), and Canagliflozin and Renal Events in Diabetes with Established Nephropathy Clinical Evaluation (CREDENCE) trials**

Trial	FDA indicated guidelines	Study renal entry criteria			Results	
	Minimum recommended eGFR	eGFR minimum	eGFR equation	Additional renal criteria	Mean eGFR	Composite renal outcome
DECLARE-TIMI 58	45	N/A	CKD-EPI	CrCl 60 mL/min (Cockcroft-Gault equation)	85.2	≥ 40% reduction in eGFR to < 60, ESRD (dialysis ≥ 90 days, transplant or sustained eGFR < 15), or renal/CV death
CANVAS	45	30	MDRD	N/A	76.5	≥ 40% reduction in eGFR, RRT (transplant, chronic dialysis, or sustained eGFR < 15), or renal death
EMPA–REG OUTCOME	45	30	MDRD	N/A	74	Doubling of serum Cr with eGFR ≤ 45, RRT, or renal death
CREDENCE	45	30	CKD-EPI	UACR 300–5000	56.2	Doubling of serum Cr, ESRD (eGFR < 15, dialysis, or renal transplant), renal/CV death

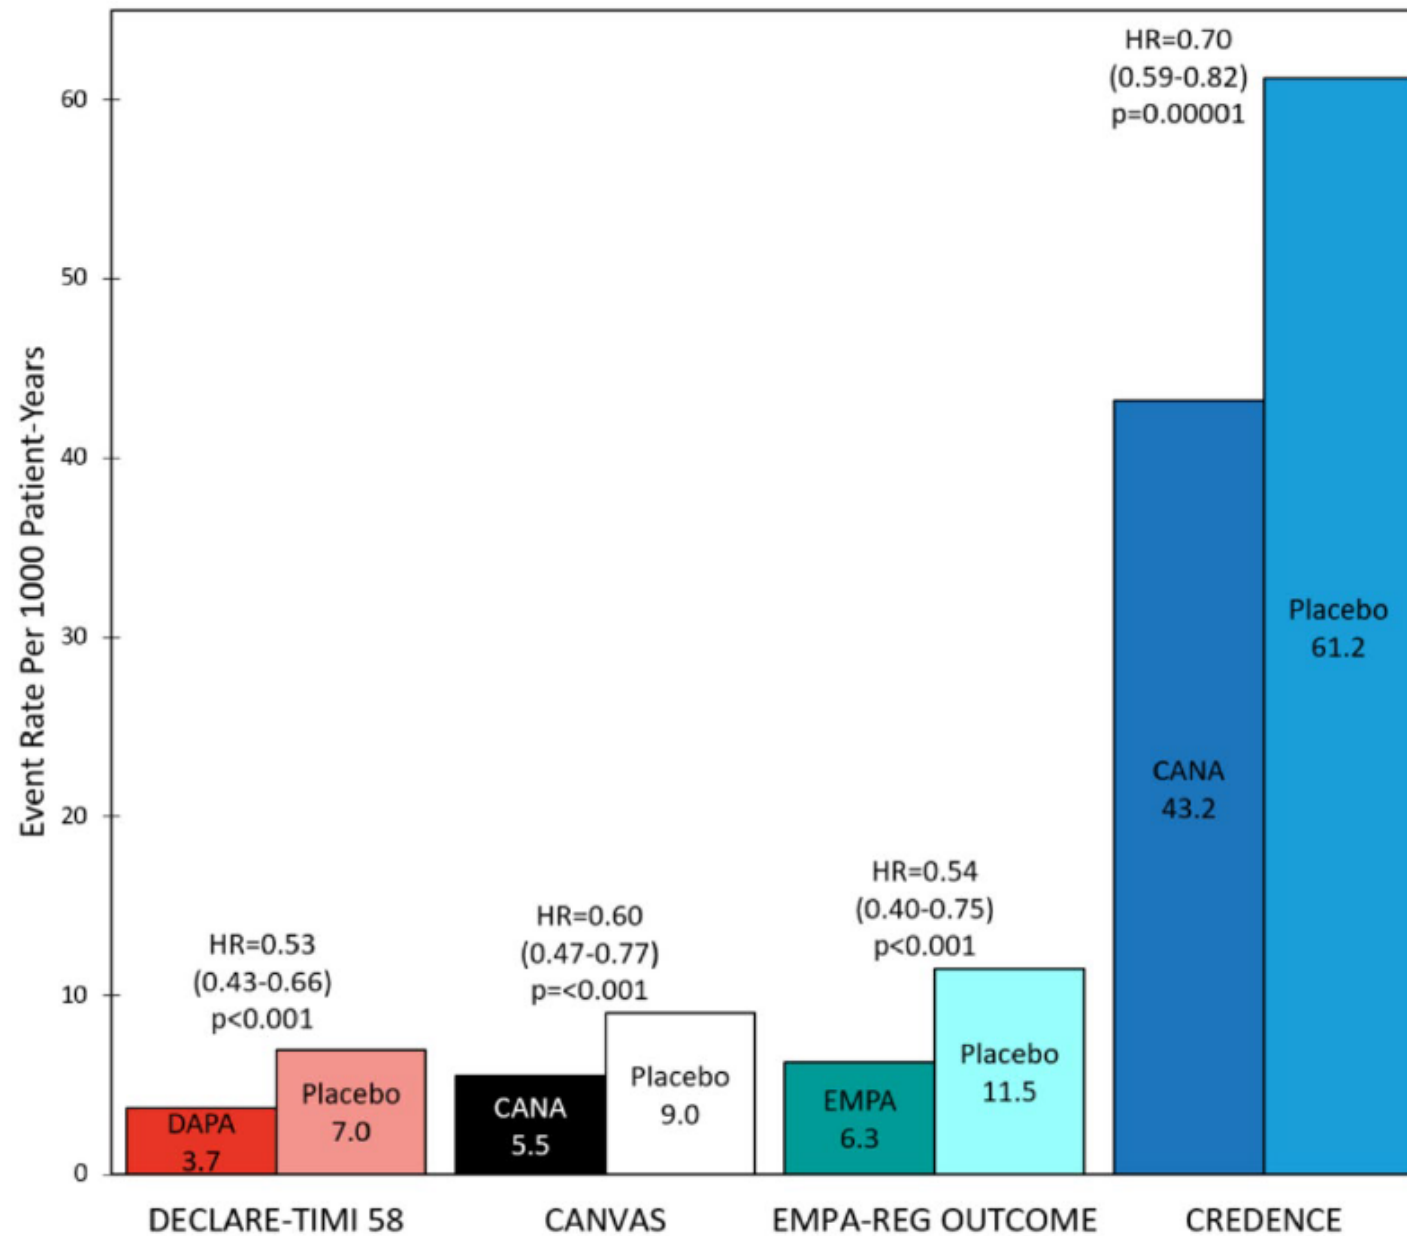

All eGFRs are in mL/min/1.73 m<sup>2</sup>

eGFR estimated glomerular filtration rate, MDRD modification of diet in renal disease, CKD-EPI chronic kidney disease epidemiology collaboration, RRT renal-replacement therapy, ESRD end-stage renal disease, CV cardiovascular, CrCl creatinine clearance, Cr creatinine, UACR urinary albumin-creatinine ratio in mg/g

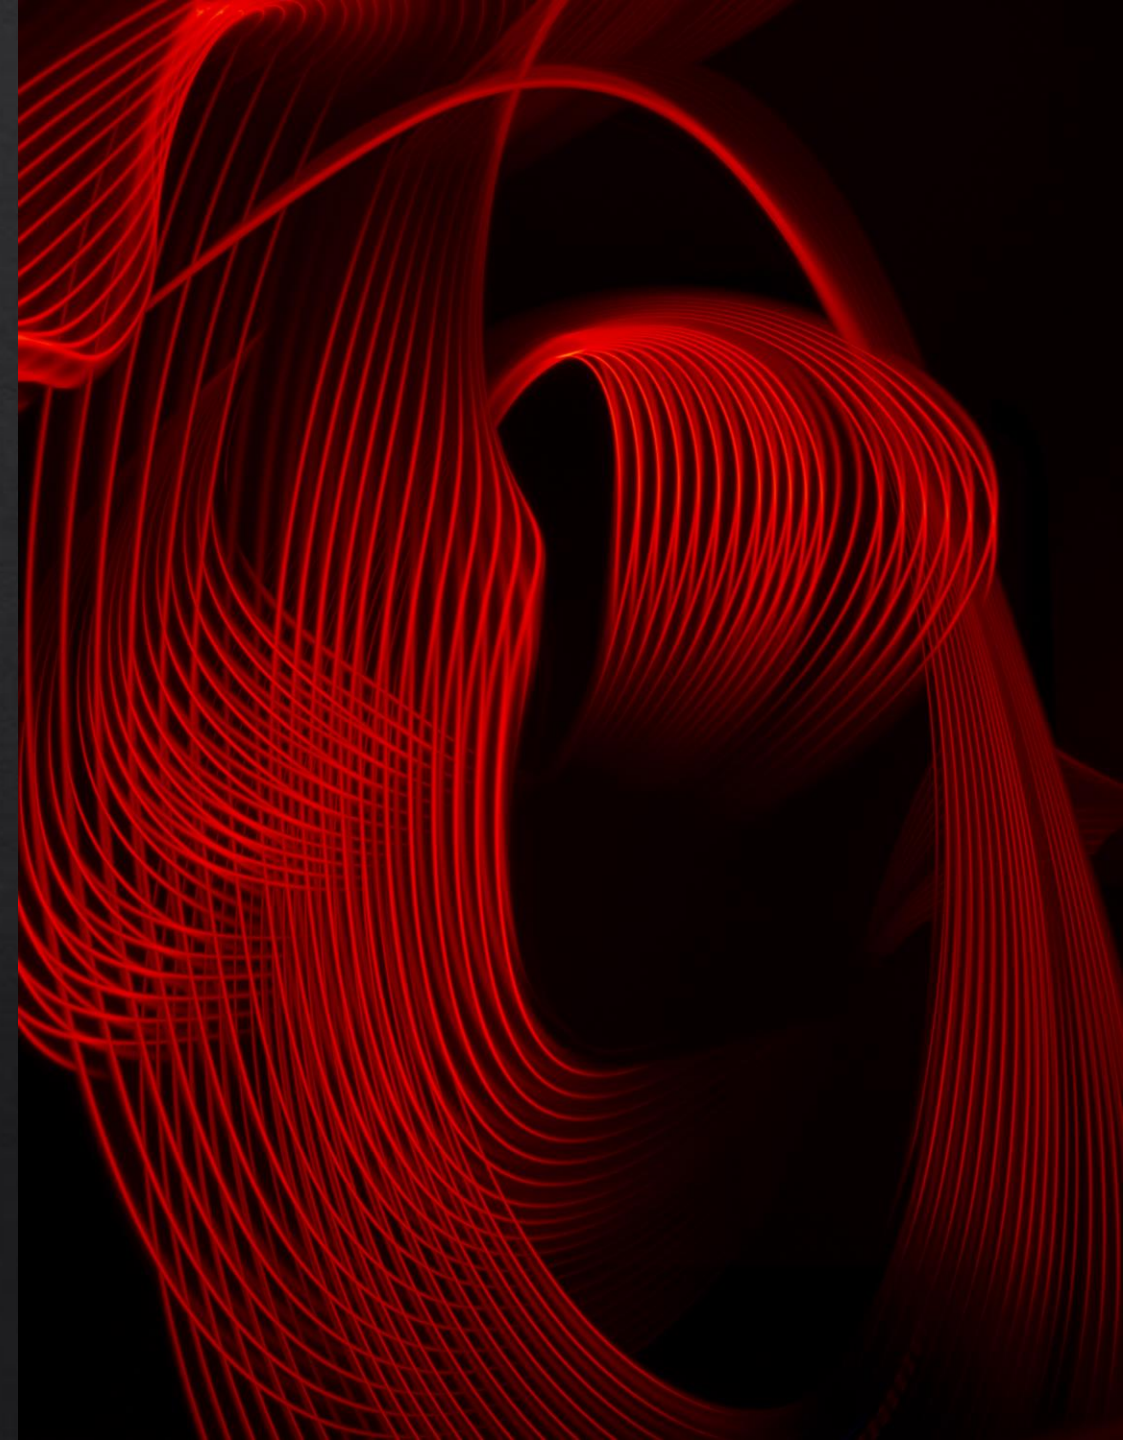

**Fig. 4** Heart failure hospitalization (HHF), HHF and cardiovascular (CV) death, and major adverse cardiovascular event (MACE) relative risk reductions (RRRs) in the Dapagliflozin Effect on Cardiovascular Events (DECLARE-TIMI 58), Canagliflozin Cardiovascular Assessment Study (CANVAS) Program, Empagliflozin Cardiovascular Outcome Event Trial in Type 2 Diabetes Mellitus Patients—Removing Excess Glucose (EMPA-REG OUTCOME), and Canagliflozin and Renal Events in Diabetes with Established Nephropathy Clinical Evaluation (CREDENCE) trials. Statistical outcomes displayed as RRR, p-value. RRRs were calculated from hazard ratios

### Composite Renal Outcomes

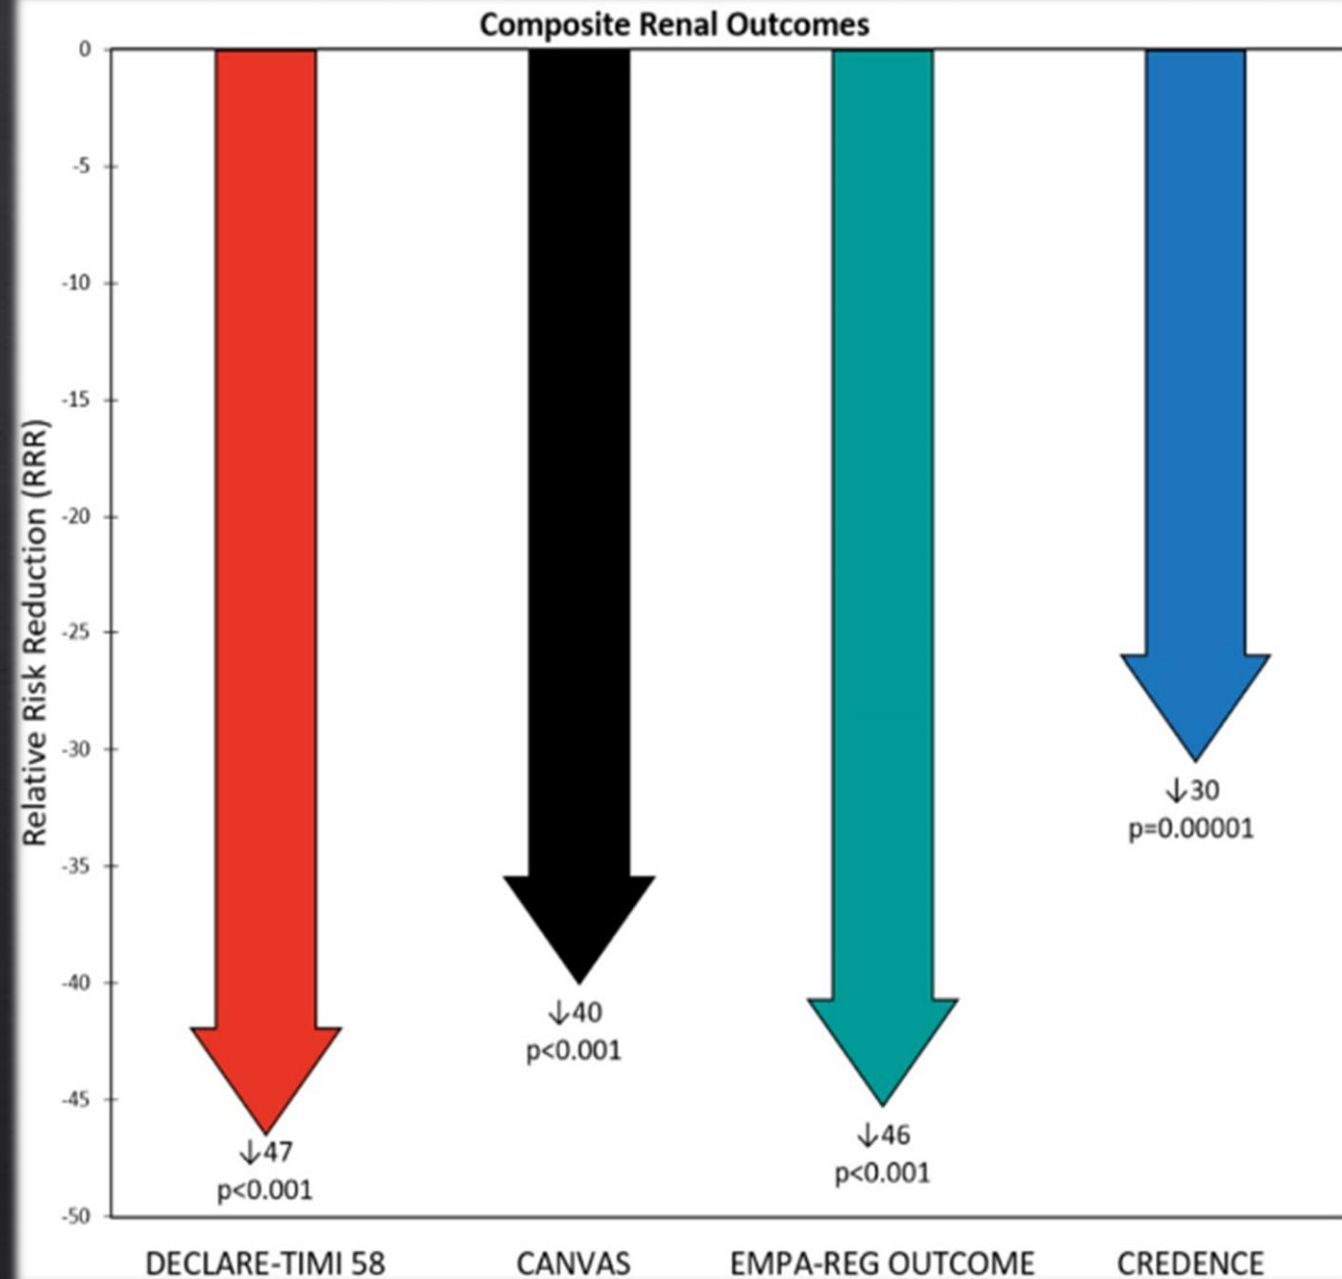

- ❖ When considering the four SGLT2i trials, overall relative risk reductions for HHF and CV death were externally consistent among them.
- ❖ The relative reductions in HHF were considerably greater than those for ischemic events including nonfatal MI and ischemic stroke.
- ❖ The absolute risks of CV events appeared to be more related to baseline renal filtration than the baseline CVD rate.
- ❖ Together, these trials establish the UACR as a risk predictor not only for renal events but also CV outcomes.

❖ The composite renal outcome RRR is another intriguing result when comparing the four trials.

> In a reversal of the trend seen with the other outcomes, CREDENCE had the smallest RRR and DECLARE-TIMI 58 the largest.

❖ Interestingly, the CREDENCE and EMPA-REG OUT-COME had similar MACE incidence rates (48.7 and 43.9/1000 patient-years, respectively), despite different baseline UACR and eGFR.

# Safety

- ❖ The four trials demonstrated several general safety trends.
- ❖ They were generally associated with increased risk of diabetic ketoacidosis, dehydration, orthostatic hypotension, and amputation and decreased risk of acute kidney injury.
- ❖ Increased risk of genital infections; however, this is expected due to the glucosuria.
- ❖ Fournier's gangrene.

**Table 3 Risk associated with study drug compared to placebo for adverse events in the Dapagliflozin Effect on Cardiovascular Events (DECLARE-TIMI 58), Canagliflozin Cardiovascular Assessment Study (CANVAS) Program, Empagliflozin Cardiovascular Outcome Event Trial in Type 2 Diabetes Mellitus Patients—Removing Excess Glucose (EMPA-REG OUTCOME), and Canagliflozin and Renal Events in Diabetes with Established Nephropathy Clinical Evaluation (CRENDENCE) trials**

# Class Effect of SGLT2 i

- ◆ **What does class effect mean?**
- ◆ **Should be based on three concepts: a similar chemical structure, a similar mechanism of action and similar pharmacological effects, and adverse reactions.**
- ◆ **“class labeling”**
- ◆ **The trials are externally consistent with each other, showing reliable cardiorenal benefit (according to baseline risk) and comparable adverse effects.**
- ◆ **The SGLT2i studied have similar known mechanisms of action resulting in losses of glucose and sodium in the urine and reductions in blood pressure and body weight.**

# Future Potential Benefits

- ◇ SGLT2i have demonstrated a host of positive effects of interest for future research.
- ◇ In animal models of T2DM female mice, empagliflozin ameliorated kidney injury by promoting glycosuria, and possibly by reducing systemic and renal artery stiffness.
- ◇ Canagliflozin attenuated the progression of atherosclerosis, reducing hyperlipidemia, hyperglycemia, and inflammation by lowering the expression of some inflammatory molecules.
- ◇ **Class of medication to treat patients beyond diabetes...**

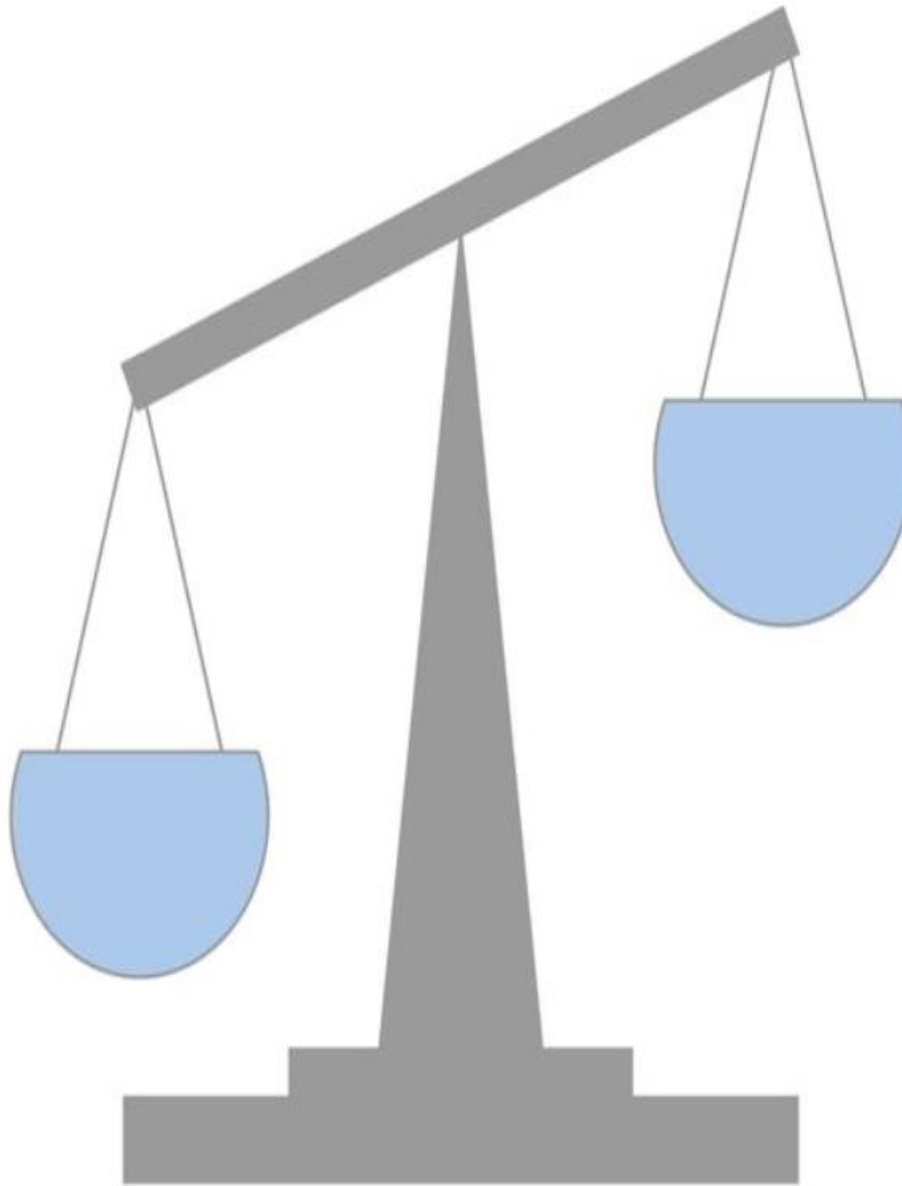

# Take Home Message

- ❖ Dapagliflozin, empagliflozin, and canagliflozin have internally and externally consistent class effects on cardiorenal outcomes and similar safety profiles.
- ❖ Baseline renal filtration function and degree of albuminuria are the most significant indicators of risk for both CV and renal events.
- ❖ Thus, these two factors also anticipate the greatest clinical benefit for SGLT2i.

### Favorable effects

- Reduction of pre-load (diuretic effects)
- Reduction of afterload (blood pressure, arterial stiffness)
- Improvement of mitochondrial efficiency
- Delay of decline in eGFR
- Delay of micro- and macroalbuminuria
- Weight loss
- Reduction in epicardial adipose tissue
- Improvement in glycemia
- Reduction in uric acid

### Unfavorable effects

- Amputations (in particular toe, metatarsal)
- Volume depletion/Hypotension
- Diabetic ketoacidosis
- Fractures
- Urinary and genital infections

History of Heart Failure	1,777 (21.6)	706 (10.1) <sup>b</sup>	1,461 (14.4)	1,698 (9.9)

Data are n (%) or mean ± SD, unless otherwise shown. NA = data not available. <sup>a</sup>A1C data from screening visit; <sup>b</sup>Percentage based 7,020 patients; <sup>c</sup>Coronary atherosclerotic disease; <sup>d</sup>Cerebrovascular disease; <sup>e</sup><60 mL/min/1.73m<sup>2</sup>; <sup>f</sup>Ischemic stroke.

A1C = glycosylated hemoglobin. BMI = body-mass index. CABG = coronary artery bypass graft. eGFR = estimated glomerular filtration rate by MDRD. PCI = Percutaneous Coronary Intervention.
